2. Description

The Trent 1000 engine is a three shaft high bypass ratio, axial flow, turbofan with Low Pressure, Intermediate Pressure and High Pressure Compressors driven by separate turbines through coaxial shafts. The LP Compressor fan diameter is 2.85m with a swept fan blade and OGV's. The combustion system consists of a single annular combustor with 18-off fuel spray nozzles. The LP and IP assemblies rotate independently in an anti-clockwise direction, the HP assembly rotates clockwise, when viewed from the rear of the engine. The Compressor and Turbine have the following features:

Compressor	Turbine
LP – Single stage	LP – 6 stage
IP – 8 stage	IP – single stage
HP – 6 stage	HP – single stage

The engine control system utilises an EEC (Electronic Engine Controller) which has an airframe interface for digital bus communications. An EMU (Engine Monitor Unit) is fitted (to provide vibration signals to the aircraft).

3. Equipment

For details of equipment included in the type design definition: refer to Installation Manual.

For details of equipment and nacelle hardware supplied by the Airframe TC holder that may be mounted on or driven by the engine: refer to Installation Manual.

Note: The engine is certified for use with an operable Thrust Reverser Unit. Note that the Thrust Reverser Unit does not form part of the engine type design and is certified as part of the aircraft type design.

10. Maximum Permissible Air Bleed Extraction

Only the Trent7000-72 and Trent7000-72C engine models supply compressor air to the airframe for the purpose of cabin ventilation (“Cabin Bleed”). VI. Notes

1. The Equivalent Bare Engine Take-off and Maximum Continuous thrusts quoted in Section III sub level 6 are derived from the approved Net Take-off and Net Maximum Continuous thrust by excluding the losses attributable to the inlet, cold nozzle, hot nozzle, by-pass duct flow leakage and the after body.
2. The Ratings are based on having no power offtakes to aircraft accessories nor air bleeds.
3. The take-off rating and the associated operating limitations may be used for up to 10 minutes in the event of an engine failure.
4. All Models except Trent7000-72 and Trent7000-72C. The control and monitoring system software meets the following levels according to EUROCAE ED-12B/RTCA DO178B:
 - EEC is designated Level "A".
 - EMU is designated Level "E", except that the flight deck vibration display is Level "C".

Trent7000-72 and Trent7000-72C. The control and monitoring system software meets the following levels:

- EEC is designated EUROCAE ED-12B/RTCA DO178B Level "A".
 - EMU is designated EUROCAE ED-12C/RTCA DO178C Level "C".
5. Refer to Installation Manual for details of Electro-Magnetic Interference (EMI), High Intensity Radiated Fields (HIRF) and Lightning capability.
 6. The maximum exhaust gas over temperature limit is approved for inadvertent use for the periods specified without requiring maintenance action. The cause of the over temperature must be investigated and corrected.
 7. Turbine Gas Temperature is measured by thermocouples positioned at the 1st stage Nozzle Guide Vane of the LP Turbine.
 8. The Maximum Continuous Speed limitations defined in this Data Sheet are not displayed as limitations on the Aircraft flight deck. Non-display of these limitations was agreed during the certification programme.
 9. The Trent 1000-Z Model approved at original certification was deleted at Issue 2 of TCDS E.036. No examples of this Model have been produced and this model is no longer required.
 10. Issue 2 of TCDS E.036 also updated the minimum build standard approved under the Type Certificate as defined in Section III paragraph 1.
