201509283	11/07/2015	EGTT : London (FIR)	THRED	5nm ESE	A	Airway - ATS Route	CIRRUS	Reciprocating	1	Infringement of Airway Q41 (Class A) by an unknown aircraft squawking 3673, indicating 5500ft, descending. Aircraft identified as a SR22. Standard separation maintained.	SR22 infringers Q41 south of THRED. I was operating as Solent Radar at approximately 1325z when the coordinator pointed out a FIS squawk SE of THRED in AWY Q41, indicating A055 descending on a north westerly track. The coordinator advised that S21 had declined coordination with London FIS for it to cross and that it would be calling Solent - details SR22. When it did call it was past THRED to the SW and was put on a 3673. The mode C was checked and I therefore advised the pilot he had crossed an airway without permission. The pilot said there was no airway on his chart. On leaving the aircraft was transferred to radar at 1331z. No other aircraft were affected.☐ Supplementary 14/07/15:☐ Infringement of airway Q41 by VFR traffic callsign SR22. I was working London FIS West and North sectors combined as FISO 2. FISO 1 was working FIS East which was split off due to traffic loading. It was with reasonably good weather, and traffic at the time of this event was moderate. I took over the sector at 1300Z and had several airplanes of frequency. At 1320 I received a call from SR22 requesting descent from FL65, with 14 mins to destination. I had no details of this callsign, and as far as I knew it was not on my frequency. I informed the pilot he was unknown traffic to me and asked for details. He apologised and explained that he had been working another ATC sector and that he thought his details had been passed by them to London, prior to his call. He reported mid-channel and that he was at FL65 and requesting descent. At that FL I was initially concerned that he may be in close proximity to airway Q41. I instructed him to squawk 1177 and confirmed he would remain
201509292	10/07/2015	EGTT : London (FIR)	LAM	5nm E	A	TMA	FLIGHT DESIGN	Unknown	1	Infringement of the LTMA (Class A) by a Flight Design microlight at 3300ft, resulting in loss of separation with traffic. London City departures stopped. CAIT activated. Traffic info given.	Infringement of Class A TMA by Flight Design microlight. CAIT alerted when entered CAS without a clearance at approx. 1025 UTC. Blind calls were made but Flight Design microlight made no response. Calls to other airfields were made to see if Flight Design microlight was on their freq. A Thames CHECK ALL was placed in order to stop all London City departures. Inbounds to London City were given extended vectors and delayed to ensure separation from the infringer. Inbounds via DET were not accepted on the standing agreement. TC North, South and Gatwick were informed of the infringing aircraft. Flight Design microlight was observed to track southbound at approx. 3300ft +/-200ft. The base of CAS is 2500ft in this area. Further details were gained from TC Essex with whom it was working earlier.

201509292	10/07/2015	EGTT : London (FIR)	LAM	5nm E	A	TMA	UNKNOWN	Unknown		Infringement of the LTMA (Class A) by a Flight Design microlight at 3300ft, resulting in loss of separation with traffic. London City departures stopped. CAIT activated. Traffic info given.	Infringement of Class A TMA by Flight Design microlight. CAIT alerted when entered CAS without a clearance at approx. 1025 UTC. Blind calls were made but Flight Design microlight made no response. Calls to other airfields were made to see if Flight Design microlight was on their freq. 201509294	10/07/2015	EGTT : London (FIR)	EGSS (STN): London/Stansted	CTA	D	CTA	FLIGHT DESIGN	Reciprocating	1	Infringement of the Stansted CTA (Class D) by a Flight Design microlight squawking 7000, indicating 2600ft. AIW activated. Traffic info and avoiding action given. Standard separation maintained.	Flight Design microlight infringe of Stansted CTA. Whilst working A319 on a Buzzard departure runway 22 I noticed Flight Design microlight indicating 2600ft tracking Eastbound. Initially inside CAS with base of 2500ft he then entered the CTA base of 1500ft. As A319 was already turning northwards and climbing to FL70 I passed traffic information and explained that the best action was for A319 to continue his heading - avoiding action therefore not given laterally. I also didn't issue avoiding action climb as A319 was already climbing under the inbound flight level and I didn't want the pilot to level bust (the distance between A319 and the infringer always improving). Flight Design microlight was identified by Mode S and eventually contacted Farnborough LARS (they issued a squawk). Supplementary 14/07/15: I was working as the LARS N controller whilst also carrying out OJTI. The frequency was fairly busy. Flight Design microlight had been on frequency for approximately six minutes and had been previously given advice to avoid the Stansted CTA. Both myself and the trainee were focused on another part of the airspace due to traffic routing North of Stansted CTA on frequency when the AIW alert generated and Flight Design microlight was observed to be just inside the Stansted CTR and was immediately instructed to turn North to leave CAS. At the same time we had a phone call from Essex radar advising that they had to take avoiding action.
201509294	10/07/2015	EGTT : London (FIR)	EGSS (STN): London/Stansted	CTA	D	CTA	AIRBUS	Turbofan	2	Infringement of the Stansted CTA (Class D) by a Flight Design microlight squawking 7000, indicating 2600ft. AIW activated. Traffic info and avoiding action given. Standard separation maintained.	Flight Design microlight infringe of Stansted CTA. Whilst working A319 on a Buzzard departure runway 22 I noticed Flight Design microlight indicating 2600ft tracking Eastbound. 201509295	10/07/2015	EGTT : London (FIR)	EGTO (RCS): Rochester		A	TMA	CESSNA	Reciprocating	1	Infringement of the LTMA (Class A) by a C172 squawking 7000, climbing to 3400ft. Standard separation maintained.	C172 infringement of LTMA. I was on Thames radar with a trainee when C172 was observed climbing into the TMA, CAIT activated, on a NW'ly track. A blind transmission was made and the A/C was seen to climb to 3400ft QNH 1022. The squawk changed from 7000 to 4575 squawk and was confirmed as C172 which was instructed by Southend to turn onto a N'ly track as it was about to enter the London City CTR.
201509298	11/07/2015	EGTT : London (FIR)	LAM		A	TMA	PIPER	Reciprocating	1	Infringement of the LTMA (Class A) by an unknown aircraft, indicating 2600ft. Aircraft identified as a Piper Cub. CAIT activated. Traffic info and avoiding action given to an inbound BAe125. Standard separation maintained.	Piper Cub infringement causing avoiding action on BAe125. I was the Thames radar controller when BAe125 came on frequency from London on his agreed release of LAM 180 degrees 4000ft, I was alerted to an a/c that had climbed into CAS by CAIT showing 2600ft 5 miles south of BAe125. I gave avoiding action and traffic information to BAe125, avoided the unknown traffic and continued with a normal approach.

201509298	11/07/2015	EGTT : London (FIR)	LAM		A	TMA	BAE	Turbofan	2	Infringement of the LTMA (Class A) by an unknown aircraft, indicating 2600ft. Aircraft identified as a Piper Cub. CAIT activated. Traffic info and avoiding action given to an inbound BAe125. Standard separation maintained.	Piper Cub infringement causing avoiding action on BAe125. I was the Thames radar controller when BAe125 came on frequency from London on his agreed release of LAM 180 degrees 4000ft, I was alerted to an a/c that had climbed into CAS by CAIT showing 2600ft 5 miles south of BAe125. I gave avoiding action and traffic information to BAe125, avoided the unknown traffic and continued with a normal approach.
201509300	11/07/2015	EGTT : London (FIR)	EGKK (LGW): London/Gatwick		D	CTR	MUDRY	Reciprocating	1	Infringement of the Gatwick CTR (Class D) by an aircraft squawking 7000 observed climbing to 2100ft. Traffic info and avoiding action given. Separation lost.	I was on duty as KK INT. RW 26L. At 0847 I spotted a 7000 sqk at 1.7A to the north of the centre line. At this time A330 was on a base leg at 3A I gave avoiding action to the A330 and turned him heading 260 and told him where the infringer was. The infringer continued climbing up to 2.1A and eventually left the CTA to the west and left controlled airspace. From mode S the aircraft was identified. I called Redhill to see if they were still working him but they told me that he had left their frequency. A330 was then vectored back onto the ILS. At the same time I also had an A319 downwind dropping to 4A who I gave a right hand orbit to and stopped him at 5A in case the infringer turned southbound. I believe separation was lost between the infringer and the A330.
201509300	11/07/2015	EGTT : London (FIR)	EGKK (LGW): London/Gatwick		D	CTR	AIRBUS	Turbofan	2	Infringement of the Gatwick CTR (Class D) by an aircraft squawking 7000 observed climbing to 2100ft. 201509303	11/07/2015	EGTT : London (FIR)	EGGW (LTN): London/Luton	8nm S	D	CTR	PIPER	Reciprocating	1	Infringement of the Luton CTR (Class D) by an unknown aircraft squawking 5022. Aircraft identified as a PA28. ATC broke an A319 off approach to R/W26. CAIT activated. Traffic info given. Standard separation maintained.	Infringement of CTR by PA28. Whilst working as INT I noticed a Farnborough LARS Squawk tracking towards the zone boundary (5022 squawk) I called them to discuss remedial action to take it away. It entered the zone and activated sCait. I elected to break off an inbound A319 aircraft until the contact under Farnborough LARS instruction departed the zone to the South. A later phone call whilst in the position established that the aircraft was a PA28, trying to get to destination although the controller stated that he was unfamiliar with the airspace around the TMA.☐ Supplementary 14/07/15:☐ I was working as the solo LARS North controller in medium traffic. PA28 was on frequency and reported tracking LAM to BPK. Luton Radar rung the LARS North land line and advised me that PA28 was on track to infringe the Luton Control Zone. I immediately spoke to PA28 and advised him to turn left and to track south to leave the Luton Control Zone. The pilot asked me to repeat this which I did. The pilot then started his South Bound turn to leave the Luton Zone. At this point I observed an inbound to Luton being broken off the Approach. PA28 once outside Controlled Airspace then went on to request a Luton Zone transit as it appeared he was unfamiliar with the airspace around the Luton Zone. I spoke to Luton Radar but due to traffic density it was declined and a service outside the zone was offered. I said if PA28 was to remain outside I would keep him and work him on my frequency which the Luton Controller agreed.

201509303	11/07/2015	EGTT : London (FIR)	EGGW (LTN): London/Luton	8nm S	D	CTR	AIRBUS	Turbofan	2	Infringement of the Luton CTR (Class D) by an unknown aircraft squawking 5022. 201509306	11/07/2015	EGTT : London (FIR)	EGKR (KRH): Redhill	1.75nm SE	D	CTR	PIPER	Reciprocating	1	Infringement of the Gatwick CTR (Class D) by a PA28. Standard separation maintained.	Minor infringement of Gatwick CTR by PA28. PA28 reported over DORKING returning from previous sector; the pilot reported receipt of ATIS Information P and I instructed him to squawk 3767 and to report at a specific VRP. When the pilot piloted at the VRP there were several other fixed-wing joining or already in the fixed-wing visual circuit so I instructed the pilot to make "ONE ORBIT AND THEN JOIN RIGHT BASE." At approximately 1550hrs the pilot reported "GST JUST COMPLETED THE ORBIT" and I replied "PA28 JOIN RIGHT BASE YOU'RE NUMBER NUMBER TWO FOLLOWING AN AIRCRAFT TURNING FINAL." The pilot correctly read this back. At approximately 1552hrs a helicopter made a standard position report as I observed PA28 continue south through the extended centre line of Runway 26L, as soon as this transmission finished I transmitted "PA28 YOU'VE GONE THROUGH THE CENTRE LINE MAKE A LEFT TURN, LEFT TURN BACK ON TO FINAL FOR RUNWAY 26L." The pilot of PA28 did not reply however another aircraft then made a transmission about taxiing when this transmission finished I called PA28 again saying "PA28 TOWER TURN LEFT PLEASE TURN LEFT" the pilot replied "PA28 TURNING LEFT." I added "THAT'S IT RUNWAY 26L YOU ARE SOUTH OF THE CENTRE LINE TURN LEFT PLEASE BACK ON TO FINAL FOR RUNWAY 26L." A helicopter then requested joining instructions; whilst passing these I observed the PA28 commencing the left turn however it was slower than I expected at which point the Gatwick telephone line rang. I answered the phone whilst again telling PA28 to turn back towards the final approach for Runway 26L. I confirmed to Gatwick TC Director that PA28 was turning back. I estimate that PA28 was
201509308	11/07/2015	EGTT : London (FIR)	EGDX : St. Athan		D	CTR	AERO VODOCHODY	Turbofan	1	Aircraft was released and not coordinated as per the letter of agreement.	I was the aerodrome controller. I was operating in accordance with SRATCOH extension for Weekend operations as granted by CAA SARG for MOD St Athan. At approximately 0920UTC aircraft called for taxi and was given standard instructions to taxi to holding point A along with departure instructions for a Nash South departure as detailed in the St Athan - Cardiff Letter of Agreement (LOA). A second aircraft was cleared to land at 0921, and the L29 aircraft was given conditional line up instructions. At approx 0922, the second aircraft vacated Runway 28 and the L29 was given take-off clearance, getting airborne at 0923. Approx one minute after departure I instructed the aircraft to contact Cardiff Radar on frequency 119.150. At approx 0925 I received a call from Cardiff Radar on the landline enquiring whether I had just launched an aircraft I confirmed that was correct and it was this point I realised that i had not obtained the St Athan LFZ from Cardiff ATC. Without the LFZ St Athan is required to 'Check before Release' with Cardiff ATC before all departures. As per the LOA.☐ Supplementary 12/07/15:☐ Radar positions were split. Workload was light. EGDY ATC was open on runway 26. LFZ NOT active. At approx. 0925 aircraft free-called Radar 2 on 119.15 outbound from EGDY via Nash Point. No primary or secondary radar contact was seen. The aircraft had been pre-noted to Cardiff and FPS produced, but EGDY had not 'Checked Before Release'. The aircraft therefore entered the CTR without a clearance or knowledge of Cardiff ATC. The EGDY ATCO apologised and stated they had not appreciated a CBR was required when
201509315	11/07/2015	EGTT : London (FIR)	EGSS (STN): London/Stansted	Bearing 050 Range 14nm	D	CTA	AVIONS ROBIN	Reciprocating	1	Infringement of the Stansted CTA (Class D) by a DR400 squawking 7000 at 3600ft. Traffic info given. Separation lost.	At 1718 an unknown aircraft infringed CAS to the North east of Stansted at 3600 feet. This conflicted with inbound B737. I instructed the B737 to stop descent at 5000feet and vectored it away from the infringer. I achieved about 3nms separation.☐ CAA Closure:☐ No action taken. Closed due elapsed time. Registration will be monitored.
201509315	11/07/2015	EGTT : London (FIR)	EGSS (STN): London/Stansted	Bearing 050 Range 14nm	D	CTA	BOEING	Turbofan	2	Infringement of the Stansted CTA (Class D) by a DR400 squawking 7000 at 3600ft. Traffic info given. Separation lost.	At 1718 an unknown aircraft infringed CAS to the North east of Stansted at 3600 feet. This conflicted with inbound B737. 201509316	05/07/2015	EGTT : London (FIR)	EGHI (SOU): Southampton	8nm E	D	CTA	VANS	Reciprocating	1	Infringement of the Southampton CTA (Class D) by a Vans RV7.	The flight was to test the engine. The planned flight was to get airborne in an easterly direction climbing away from the control zone. As I climbed I encountered cloud on my track and turned north to avoid it I thought I was well to the east of the zone. I spent too much time looking at the engine instruments and making control changes and forgot about my position. Looking at the engine data was, I'm afraid was all consuming I thought my position was well to the east. I should have realised after turning to avoid cloud I should have broken off the climb and reposition. Suggested actions to prevent a recurrence: To take a passenger to help note the data and to lookout. To assure myself I'm in clear airspace before attempting any information gathering.
201509326	10/07/2015	EGTT : London (FIR)	EGKB (BQH): Biggin hill		G	ATZ	EVEKTOR AEROTECHNIK	Reciprocating	1	Infringement of the Biggin Hill ATZ (Class G) by an EV97 squawking 7000. The EV97 flew through R/W21 ILS approach track, causing a C750 to go around and the Red Arrows to be held on the ground. Traffic info and avoiding action given.	Light aircraft flies through ILS approach with A/C on final. An EV97 was seen to enter the ATZ about 1 to 2nm NNE of airfield tracking West. Without any calls to ATC, he was also only showing 7000 on the ATM with no Mode C. At the same time a C750 was on the ILS at a range of approx 5nm. As EV97 got closer to the final approach I decided to send C750 around at a range of 4nm as I couldn't be certain of the altitude of EV97. C750 carried out a missed approach and was given traffic info on the crossing A/C. The pilot of C750 reported that he did not have EV97 in sight. C750 was then handed over to THAMES radar for him to hold all other inbound and outbound A/C were held while I sorted out the ATZ infringer. EV97 then continued to orbit inside the ATZ to the NW of airfield at a range of about 1.5nm over my circuit traffic who was orbiting downwind due to the inbound ILS traffic. At the same time the Red Arrows were about to depart and they were also held on the runway until I was certain that EV97 was leaving the area. He was observed on the ATM and visually routing towards their destination. I then called the EV97's destination to obtain details pf the A/C and pilot. At 1553z C750 made a second approach and landed safely.
201509326	10/07/2015	EGTT : London (FIR)	EGKB (BQH): Biggin hill		G	ATZ	CESSNA	Turbofan	2	Infringement of the Biggin Hill ATZ (Class G) by an EV97 squawking 7000. The EV97 flew through R/W21 ILS approach track, causing a C750 to go around and the Red Arrows to be held on the ground. Traffic info and avoiding action given. 201509368	14/07/2015	EGTT : London (FIR)	EGSR : Earls Colne				CESSNA	Reciprocating	1	Infringement of the Earls Colne ATZ (Class G) by a C172 at 800ft.	At the time aircraft was unknown. Flew through ATZ @ 800ft. Not communicating with air ground. EGSR telephoned Wattisham (EGUW). Explain the situation .EGUW confirmed that the aircraft was on a Farnborough squawk and that it was south east of EGSR at 800ft. Wattisham very kindly traced the aircraft. Aircraft had reportedly flown though Andrewsfield (EGSU), EGSR, and the danger zone south of Colchester at 600-800ft. Not talking to anyone.
201509535	16/07/2015	EGTT : London (FIR)	EGBE (CVT): Coventry	2mn S	D	CTA	AVIONS ROBIN	Reciprocating	1	Infringement of the Birmingham CTA 2 (Class D) by a R2160, indicating 1700ft. Avoiding action issued.	Alleged CTA2 Infringement. R2160 was orbiting on right base for runway 05, on the second orbit the aircraft indicated 1700ft on the ATM, approaching CTA2 class D. Pilot was told to report their level, response was "descending". Birmingham call radar to advise that avoiding action had been taken on the alleged infringement. Pilot advised of this once landed. Tapes not checked for accuracy.

201509536	16/07/2015	EGTT : London (FIR)	Near White Waltham		A	TMA	EVEKTOR AEROTECHNIK	Reciprocating	1	Infringement of the LTMA (Class A) by an EV97, resulting in loss of separation with an inbound A320. Traffic info and avoiding action given.	A/c was observed to be infringing on the west edge of the Heathrow control zone. I was alerted to the a/c by a CAIT alert (which displayed the a/c c/s but no level information) while A320 was on a base leg. A320 was given a turn to the right to avoid the a/c and traffic information was passed against the unknown traffic. The unknown traffic was then observed to enter the White Waltham LFA before tracking north west outside the zone. ☐ Supplementary 20/07/15:☐ At the time of the event I was the LARS West Controller split from Farnborough Approach Radar. EV97 called me routing from ***** to **** and was given a basic service with a squawk of 0431. He had no mode Charlie but reported at 1,600ft altitude on first call. During his flight I became aware of him tracking towards the London CTR on two separate occasions. My recollection of both these events was that he had not entered the London CTR, however the following day I was contacted by Swanwick investigations to provide unit comment on a loss of separation between EV97 and traffic inbound to London Heathrow. I believe the event to relate to the first time he flew towards the London CTR. I observed him tracking east and challenged his routing. I believe the aircraft reported routing to ****, and I instructed the pilot to turn left immediately to avoid the London CTR. Coincident with this RT exchange I observed the TC SVFR line ringing and I answered it promptly providing information to the SVFR controller on the 0431 being turned away. This was not why the SVFR controller was ringing, but he acknowledged the information and dealt with his other purpose. EV97 then declared he was happy to continue on his own navigation. A short while later he again
201509536	16/07/2015	EGTT : London (FIR)	Near White Waltham		A	TMA	AIRBUS	Turbofan	2	Infringement of the LTMA (Class A) by an EV97, resulting in loss of separation with an inbound A320. Traffic info and avoiding action given.	A/c was observed to be infringing on the west edge of the Heathrow control zone. I was alerted to the a/c by a CAIT alert (which displayed the a/c c/s but no level information) while A320 was on a base leg. A320 was given a turn to the right to avoid the a/c and traffic information was passed against the unknown traffic. The unknown traffic was then observed to enter the White Waltham LFA before tracking north west outside the zone. ☐ Supplementary 20/07/15:☐ At the time of the event I was the LARS West Controller split from Farnborough Approach Radar. EV97 called me routing from ***** to **** and was given a basic service with a squawk of 0431. He had no mode Charlie but reported at 1,600ft altitude on first call. During his flight I became aware of him tracking towards the London CTR on two separate occasions. My recollection of both these events was that he had not entered the London CTR, however the following day I was contacted by Swanwick investigations to provide unit comment on a loss of separation between EV97 and traffic inbound to London Heathrow. I believe the event to relate to the first time he flew towards the London CTR. I observed him tracking east and challenged his routing. I believe the aircraft reported routing to ****, and I instructed the pilot to turn left immediately to avoid the London CTR. Coincident with this RT exchange I observed the TC SVFR line ringing and I answered it promptly providing information to the SVFR controller on the 0431 being turned away. This was not why the SVFR controller was ringing, but he acknowledged the information and dealt with his other purpose. EV97 then declared he was happy to continue on his own navigation. A short while later he again
201509538	14/07/2015	EGTT : London (FIR)	EGXT : Wittering		G	ATZ	PIPER	Reciprocating	1	Infringement of the Wittering ATZ (Class G) by an unknown aircraft squawking 7000, indicating 2000ft. Aircraft identified as a PA28. Traffic info given.	I was conducting my duties as the Wittering TC(Zone) controller, during a busy period of circuit/Zone activity, when I observed a 7000 Squawk (Wittering code callsign conversion "V") tracking in a Northerly direction from a position 8nm South of Wittering. The AS was established in a slow climb that didn't rise above an indicated altitude of 2000ft on the observed (unverified) Mode C. I contacted the Wittering TC(ADC) controller and provided Traffic Information on the track, stating that it was not under a service with Wittering and that unless it was manoeuvring as part of the Sibson Aerodrome visual circuit, that it would likely infringe the MATZ and ATZ. The Witt TC(ADC) controller stated that they would pass appropriate information to circuit traffic as required. The AS was observed passing 1.7nm to the West of the Wittering Overhead, indicating an altitude between 1800ft and 2000ft on Mode C (Wittering QFE was 1007). As the AS cleared to the North of RAF Wittering the nominated DSS requested that I pursue an investigation in order to determine the identity of the AS. I requested traffic information from Swanwick (Mil) Distress and Diversion Cell, where they were able to interrogate the Mode S of the AS, identifying the callsign as PA28. Coincident with this action, the AS was observed changing its' squawk which indicated that it was receiving a service from a Waddington Zone controller. I advised the Wittering ATCO IC of the incident and my actions to determine the AS identity, including verifying the callsign with the Waddington Zone Controller. ☐ Supervisors Narrative:☐ I was acting as the ATCO I/C at the time of the incident and although not controlling at the
201509540	15/07/2015	EGTT : London (FIR)	MCT	11nm NNW	D	CTR	PIPER	Reciprocating	1	Infringement of the Manchester CTR (Class D) by an unknown aircraft squawking 7366, indicating 2300ft, resulting in loss of separation. Aircraft identified as a PA28. AIW activated.	Zone infringement PA28. I observed a 7366 squawk 5m NE of Manchester Barton indicating MODE C of 2300ft (and climbing) which had activated the AIW. I broadcast for the a/c to call me if listening out (it was then just north of Middleton). One a/c called to which I allocated a squawk, but that was not the subject target. Shortly afterwards the pilot of PA28 called on frequency and said he was in that position. I requested the pilot to select code 7351 for identification, which confirmed the a/c was PA28. I pointed out that he had climbed a little early out of the departure airfield. The pilot apologised. I continued to offer a BAS service as the a/c was now clear of the CTR and the a/c continued to track NE and left the frequency shortly afterwards. ☐ Supplementary 21/07/15:☐ Misjudged groundspeed/rate of climb ratio and infringed vertically before clearing laterally. Visual/topographical map navigation. Neither panel mounted GPS or 'Aware' in use for navigation at time of infringement. Suggested Actions to Prevent a Recurrence: Establish visual/gps way points on future plog sheets which will afford greater margins of clearance from relevant CAS volumes.
201509540	15/07/2015	EGTT : London (FIR)	MCT	11nm NNW	D	CTR	UNKNOWN	Unknown		Infringement of the Manchester CTR (Class D) by an unknown aircraft squawking 7366, indicating 2300ft, resulting in loss of separation. 201509545	16/07/2015	EGTT : London (FIR)	SAM	6nm S	D	CTR	PIPER	Reciprocating	1	Infringement of the Southampton CTR (Class D) by an unknown aircraft showing as a primary contact only. Aircraft identified as a PA28. Standard separation maintained.	PA28 infringes the Southampton Control Zone while believed to be working Bournemouth Radar. Primary contact observed within the Southampton Control Zone (bearing 180 6NM from SAM) tracking west. Blind calls made, ATSA and Coordinator made phone calls to Bournemouth and to Southampton tower, the aircraft did not respond to blind calls, the tower reported the aircraft as a low wing aircraft. The aircraft turned south and left the Southampton Control Zone at 1439, I telephoned Bournemouth again and requested they make blind calls, the ATCO reported no response and not his traffic. At 1442 the Bournemouth ATCO reported it was his traffic a PA28 from Lee on Solent to Bournemouth airport, squawking 7350. We were also operating SSR only most of the day and this would not have been observed as the Squawk was only seen once the contact was outside controlled airspace. Appropriate CAA action being taken.
201509547	16/07/2015	EGTT : London (FIR)	EGCB : Manchester/Barton	5nm SE	D	CTA	CESSNA	Reciprocating	1	Infringement of the Manchester CTA (Class D) by an unknown aircraft squawking 7000 at 2000ft. Aircraft identified as a C150. CAIT activated. Traffic info and avoiding action given. Standard separation maintained.	While on duty as APP South I noticed an AIW 5SE of Manchester Barton. It appeared that the a/c had commenced its climb about a mile west of the eastern edge of the LLR. As it crossed the boundary, into the portion of airspace with a base of 2000', the warning stopped. I had identified the call sign using mode S, and phoned Barton to enquire if they were working the traffic. They were, and advised the pilot of his infringement. □ Supplementary 20/07/15:□ Avoiding action given to DHC8 due CAIT alert in low level corridor. CAIT alert activated in low level corridor with an aircraft indicating 1700ft. DHC8 was airborne from Manchester and on the standard ASMIM departure. I immediately issued avoiding action to DHC8 to turn north and passed traffic. This was not read back so I issued it again (with traffic) and the aircraft took the turn. I haven't seen the replay so from memory I think the DHC8 was passing around 5500 - 6000ft when I issued the avoiding action distance was approx 6miles at that time (The infringing aircraft was in the DHC8's 12 o'clock position). From Mode S - callsign of infringer showed to be C150. Shortly after taking the turn the CAIT alert deactivated and the DHC8 was released on his own navigation.□ Supplementary 20/07/15:□ NOTI: Avoiding action on ASMIM departure from Manchester due to infringing aircraft.
201509547	16/07/2015	EGTT : London (FIR)	EGCB : Manchester/Barton	5nm SE	D	CTA	DE HAVILLAND	Turboprop	2	Infringement of the Manchester CTA (Class D) by an unknown aircraft squawking 7000 at 2000ft. Aircraft identified as a C150. CAIT activated. Traffic info and avoiding action given. Standard separation maintained.	While on duty as APP South I noticed an AIW 5SE of Manchester Barton. 201509629	17/07/2015	EGTT : London (FIR)	BCN		A	Airway - ATS Route	PIPER	Reciprocating	1	Infringement of Airway N864 (Class A) by an unknown aircraft squawking 7000 at FL72. Aircraft identified as a PA28. AIW activated. Standard separation maintained.	CAS infringement - Unknown Aircraft. I was the boxed radar controller under training. Workload was light. AIW activated with a 7000 squawk west of BCN by 7NM. I transmitted blind and interrogated the MODE S to try and identify the aircraft. The reg PA28 was returned by the RDP. I followed the aircraft ident towards the Gloucester area but lost the ident whilst dealing with another traffic scenario in the EXMOR area.
201509632	17/07/2015	EGTT : London (FIR)	POL	9nm NW	A	Airway - ATS Route	OTHER	Reciprocating	1	Infringement of the Manchester TMA (Class A) by an unknown aircraft climbing to 4000ft. Aircraft identified as a MCR-01 microlight. CAIT activated. Standard separation maintained,	Class A infringed in the vicinity of POL. CAIT triggered when a aircraft at approximately 1424Z 9 NM to the NW of POL climbed to 3,500 ft. where the base is 3,500ft. Over the next 2 minutes the aircraft, travelling in a south easterly direction, climbed to 4,000 ft. before descending below 3,500 ft. at approximately 1430Z 8 NM to the SE of POL. Mode S data indicates the aircraft call-sign is MCR-01 microlight. Aircraft I was working at the time: Fltnum 208 inbound descending to FL80 was on a heading through the southerly gate which passed more than 5 NM south of the infringer. Fltnum 63JF inbound, I chose not to descend below FL100 and placed the aircraft on a heading to prevent the blips merging. Fltnum 4RZ outbound was on a heading against the fltnum 63JF and subsequently was well above the infringing aircraft when travelling over (in fact the infringer was out of CAS at that point). At the point I handed the sector over to the incoming tactical controller, the infringing aircraft had left CAS and the fltnum 63JF was subsequently descended and returned to ROSUN. The sector was quiet enough that the infringer did not distract me too much from the task at hand.□ Supplementary 23/07/15:□ Lack of currency, distraction. Failure to select Manchester approach frequency and transpond listening squawk. Thermic activity and rising ground wrongly responded by climbing.

201509632	17/07/2015	EGTT : London (FIR)	POL	9nm NW	A	Airway - ATS Route	UNKNOWN	Unknown		Infringement of the Manchester TMA (Class A) by an unknown aircraft climbing to 4000ft. Aircraft identified as a MCR-01 microlight. CAIT activated. Standard separation maintained,	Class A infringed in the vicinity of POL. CAIT triggered when a aircraft at approximately 1424Z 9 NM to the NW of POL climbed to 3,500 ft. where the base is 3,500ft. Failure to select Manchester approach frequency and transpond listening squawk. Thermic activity and rising ground wrongly responded by climbing.
201509635	17/07/2015	EGTT : London (FIR)	ROSUN	Bearing NW Range 3nm	D	TMA	VANS	Reciprocating	1	Infringement of the Manchester TMA (Class A) by a RV6 squawking 7000 at 3800ft. Standard separation maintained.	As NE Planner, a CAIT alert was seen 3NM NW of ROSUN for a 7000 squawk a/c indicating A3.8 and heading NE. Mode S indicated callsign A phone call was made to Manchester APC, who had noticed the a/c but were not in communication with them. Manchester APC then called back, saying they contacted EGNO, which were providing a Basic Service to the mentioned a/c. A call was then made to EGNO to confirm a/c details. The a/c eventually descended outside CAS and turned westbound. At no point was any a/c under the control of NE sector affected by the infringer.☐ Supplementary 27/07/15:☐ This was only the second flight of this aircraft. Because the engine is new it was being run at high rpm, resulting in a lively performance with a TAS in the cruise of around 160kts. I was aware of the TMA limits and intended to remain below 3500 feet but at a safe height should engine failure occur. The windy conditions caused moderate turbulence, and a short lapse of attention to the altimeter resulted in the a/c drifting up very briefly into the TMA. Apologies.
201509639	17/07/2015	EGTT : London (FIR)	WAL VOR	8nm South	D	CTA	CESSNA	Reciprocating	1	Infringement of the Liverpool CTA (Class D) by a C182 squawking 7000 at 2500ft.	Aircraft freecalled 119.850. Aircraft told to standby due to busy traffic levels. 7000 squawk observed entering controlled airspace 8nm south of WAL VOR indicating 2500ft. Aircraft then issued a squawk of 5050. the zone infringer was then identified as a C182. Pilot had previously been in contact with Hawarden. Once aircraft had left the Hawarden ATZ, he was instructed to remain outside CAS and freecall Liverpool approach. Pilot informed by Liverpool that he had entered controlled airspace. Pilot apologised and said he thought he was a mile further west of the Liverpool zone boundary. However even the CTA to the west of Liverpool has a base of 2000ft therefore the pilot would have entered CAS regardless of his exact position.

201509644	17/07/2015	EGTT : London (FIR)	Stretton		D	CTR	PIPER	Reciprocating	1	Infringement of the Manchester CTR (Class D) by a PA28 squawking 7366 at 1300ft. Departure stopped until infringer was identified.	AIR2 telephoned to say they could see a 7366 squawk entering the zone at Stretton. I checked mode S (which showed its identity) and called the aircraft. The pilot replied, so I instructed him to return to the Low Level Route and gave him a local squawk. The mode C was not indicating a level until I requested the pilot to select it. The aircraft infringed approximately 1nm and there was no separation issue because AIR2 did not depart any traffic from Rwy 23L until the infringer was identified. At no time did the AIW activate.☐ Supplementary 21/07/15:☐ This flight was to provide a simple navigation exercise to refresh GPS free skills. My passenger accompanied me to assist in this exercise, however, the exceptionally bumpy conditions made him unwell and left me to navigate and care for him. During the sick bag handling I drifted into Manchester CTR. I should note that the remaining journey past without event and my passenger improved after a light lunch. Suggested Actions to Prevent a Recurrence: Use the GPS as a back up to chart navigation and increase hours spent out of my familiar area.
201509646	19/07/2015	EGTT : London (FIR)	EGSS (STN): London/Stansted	9nm SSW	D	CTR	CESSNA	Reciprocating	1	Infringement of the Stansted CTR (Class D) by an unknown aircraft showing as a primary contact only. Departures stopped. Aircraft identified as a C172. Standard separation maintained.	Infringement of Stansted CTR. I was mentoring an early hours trainee on FIN. Observed a primary only return tracking northeast within the Stansted TMZ2, which pCAIT had highlighted. Tried to blind call from myself and from INT, but no response received. Called Stansted Tower and stopped all departures. Called an airfield on the phone to ask if they had any traffic in that area and they reported having one "in the circuit". By this time the primary return had turned onto what would be a very wide base leg at intended destination, from its previous very wide downwind leg. Track was observed to match the positions reported to intended destination tower as it turned final. Aircraft identity obtained from intended destination, and asked them to remind pilot of need to remain within a sensibly small circuit pattern. Once established onto its final approach at intended destination, departures released at Stansted.
201509647	19/07/2015	EGTT : London (FIR)	EGCC (MAN): Manchester/Intl	17nm E	D	CTA	VANS	Reciprocating	1	Infringement of the Manchester CTA (Class D) by an unknown aircraft, indicating 3100ft, resulting in loss of separation with inbound traffic. Aircraft identified as a Vans RV8.	Zone infringement. A 6xxx squawk was observed outside CAS 8 miles east of Holme Moss transmitter heading east to west. At this point I warned Director about this traffic for information and that I wasn't working it. The aircraft then changed to 7000 and shortly after to 7366. The altitude was 3000ft indicated on Mode C and I assumed the aircraft to be flying beneath the base of CAS which was 3000ft. A short time later the AIW alerted and the mode C showed 3100ft. I called the aircraft and established contact. The aircraft reported its altitude to be 3200ft. I advised the pilot of the QNH and asked him to descend outside of CAS below 3000ft, while checking he was VMC. I also advised director what I was doing as there was inbound IFR traffic at 4000ft to the north of Vans RV8. I advised the pilot the level of the base of controlled airspace and he replied he won't do that again.☐ Supplementary 20/07/15:☐ Shortly after taking over the Final Director position, Approach South pointed out an AIW alert to the east of Glossop squawking 7366, indicating 3100ft where the base of CAS is 3000ft. Fltnum 581E was on my frequency, and whilst assessing the best means of avoiding action to maintain '5 miles and 5000ft' I heard APP S in communication with the infringing aircraft (Vans RV8) being told to descend below CAS. Since the infringing aircraft was indicating only 100ft above the base of Class D CAS and told to descend (and therefore would quickly be clear of CAS), I elected to continue normal vectoring with fltnum 581E.☐ CAA Closure:☐ Pilot error. Poor preflight planning. No further action required.
201509647	19/07/2015	EGTT : London (FIR)	EGCC (MAN): Manchester/Intl	17nm E	D	CTA	UNKNOWN	Unknown		Infringement of the Manchester CTA (Class D) by an unknown aircraft, indicating 3100ft, resulting in loss of separation with inbound traffic. Poor preflight planning. No further action required.
201509648	19/07/2015	EGTT : London (FIR)	BKY	3nm W	D	CTA	HUNTING PERCIVAL	Turbofan	1	Infringement of the Luton CTA (Class D) by an unknown aircraft squawking 7000, climbing to 2900ft, resulting in loss of separation with an inbound A319. Aircraft identified as a Jet Provost.	Infringer Jet Provost loss of separation against A319. At approx. 1645 7000 squawk was observed west of BKY at 2600. A319 was on base leg for 26 descending to 3000ft. The contact was observed descending back to 2500ft so I allowed the A318 to continue on base leg. As they passed abeam each other, Jet Provost was observed climbing again, eventually up to 2900ft. I didn't give avoiding action as they were opposite direction and already passing each other. The A319 was then given a turn to the localiser. I tracked the contact and as it returned to destination, the controller there passed me his details.☐ Supplementary 20/07/15:☐ Infringement of Luton/Stansted buffer. At approx. An aircraft later identified as Jet Provost was observed in the buffer indicating a Mode C altitude of 2700'. This quickly changed to 2400' then later went up again and at some stage was indicating 3000'. A319 was on an easterly heading to the north of the infringing aircraft descending to 6000'. At the same time outbound aircraft was climbing through approx. 6500' for FL80 2-3nm to the SE of the infringer. No action was taken by either INT or FIN as it was determined there was no immediate collision risk. In the case of A319 a turn away from the infringing aircraft would have posed a risk due to traffic to the north and northeast.☐ Supplementary 10/08/15:☐ The purpose of the flight was general handling and Display Authorisation workup sortie operating to the West of Duxford in the Bassingbourn area under the 4500' LTMA. The aircraft was being operated solo. Having departed under the 1500' Stansted TMZ stub, a

201509648	19/07/2015	EGTT : London (FIR)	BKY	3nm W	D	CTA	AIRBUS	Turbofan	2	Infringement of the Luton CTA (Class D) by an unknown aircraft squawking 7000, climbing to 2900ft, resulting in loss of separation with an inbound A319. Aircraft identified as a Jet Provost.	Infringer Jet Provost loss of separation against A319. At approx. 1645 7000 squawk was observed west of BKY at 2600. A319 was on base leg for 26 descending to 3000ft. The contact was observed descending back to 2500ft so I allowed the A318 to continue on base leg. As they passed abeam each other, Jet Provost was observed climbing again, eventually up to 2900ft. I didn't give avoiding action as they were opposite direction and already passing each other. The A319 was then given a turn to the localiser. I tracked the contact and as it returned to destination, the controller there passed me his details.☐ Supplementary 20/07/15:☐ Infringement of Luton/Stansted buffer. At approx. An aircraft later identified as Jet Provost was observed in the buffer indicating a Mode C altitude of 2700'. This quickly changed to 2400' then later went up again and at some stage was indicating 3000'. A319 was on an easterly heading to the north of the infringing aircraft descending to 6000'. At the same time outbound aircraft was climbing through approx. 6500' for FL80 2-3nm to the SE of the infringer. No action was taken by either INT or FIN as it was determined there was no immediate collision risk. In the case of A319 a turn away from the infringing aircraft would have posed a risk due to traffic to the north and northeast.☐ Supplementary 10/08/15:☐ The purpose of the flight was general handling and Display Authorisation workup sortie operating to the West of Duxford in the Bassingbourn area under the 4500' LTMA. The aircraft was being operated solo. Having departed under the 1500' Stansted TMZ stub, a
201509649	16/07/2015	EGTT : London (FIR)	EGLD : Denham	1nm West	D	CTR	PIPER	Reciprocating	1	Infringement of the London CTR (Class D) by a PA28 squawking 7000 at 1300ft. Traffic info and avoiding action given.	Military aircraft was being vectored inbound for the PAR at 10miles within the Northolt Radar Manoeuvring Area in the descent to 1800ft. PA28 appeared to be making an approach to Denham at the time squawking 7000 and indicating 1300ft however, aircraft continued to track southbound entering the NRMA 1nm west of the Denham ATZ boundary turning from white to purple and indicating 1100ft on our radar screen. I immediately stopped military aircraft's descent to 2000ft and issued avoiding action to turn left heading 360 degrees to avoid. Denham were contacted immediately and established that it was their aircraft and instructed them to turn the infringer east into their ATZ at 1000ft. Military aircraft was vectored further left and turned inbound to re-establish on the PAR once separation was achieved.☐ Supplementary 24/07/15:☐ Coming from Nottingham I reported at St Giles noticed another aircraft in the circuit so I tracked approximate south west bound to maintain separation. I was setting up the aircraft for 06 when I got a call to turn East momentarily disorientated I turned slightly west then corrected and turned East thus seeming I was continuing south.
201509649	16/07/2015	EGTT : London (FIR)	EGLD : Denham	1nm West	D	CTR	UNKNOWN	Unknown		Infringement of the London CTR (Class D) by a PA28 squawking 7000 at 1300ft. Traffic info and avoiding action given.	Military aircraft was being vectored inbound for the PAR at 10miles within the Northolt Radar Manoeuvring Area in the descent to 1800ft. 201509707	17/07/2015	EGTT : London (FIR)	EGXT : Wittering				CESSNA	Reciprocating	1	Infringement of the Wittering ATZ (Class G) by a C150 squawking 7000 at 1900ft. Traffic info given.	As 2 air systems (AS) were due to depart a 7000 squawk was observed (code callsign 'V') 4-5nm South of Wittering proceeding in a North Westerly direction, indicating mode C 1900ft. I passed traffic information to the Wittering ADC controller and attempted to hail the AS on the published VHF Zone Frequency 119.675 and legacy VHF frequency 125.525. There was no noticeable response to this request from AS at 1315Z or 1318Z. As the second of the AS became airborne I provided advice on the conflicting aircraft which was now within 1nm and 400ft on mode C (Wittering QFE 1000hPa). Second AS became visual with the conflicting AS following provision of further traffic information. At this point the conflicting AS was observed adjusting its' track to a Southerly heading. I called the Swanwick (Mil) Distress and Diversion Cell requesting that they interrogate the Mode S of the conflicting AS in order to determine its' call sign. They confirmed it was based at Peterborough Sibson airfield. I monitored the AS track as it recovered directly to Sibson and telephoned Sibson flying club in order to describe the events as observed. They advised that the aircraft was airborne from Sibson and that they would debrief the pilot and advise Wittering ATC once complete. I advised the Unit FSO(BM) and ASIMS Occurrence manager. NFTR.
201509707	17/07/2015	EGTT : London (FIR)	EGXT : Wittering				GROB	Reciprocating	1	Infringement of the Wittering ATZ (Class G) by a C150 squawking 7000 at 1900ft. Traffic info given. 201509819	18/07/2015	EGTT : London (FIR)	Reading	4nm W	A	TMA	SCHEMPP HIRTH	Reciprocating	1	Infringement of the LTMA (Class A) by a Ventus 2CT glider.	Level bust - Airspace infringement LTMA 4500+. I was returning to airfield under sustainer engine after a failed cross-country flight. I started the engine south east of Benson at approx 2600' QNH. I climbed on track routing around Chiltern Park heading direct to airfield. Under power I became concerned that I had insufficient fuel and became preoccupied with keeping a lookout and monitoring the steadily decreasing fuel gauge reading. I was concerned that I would gain insufficient height to complete a glide to airfield if the engine suddenly quit. I had another airfield in range so there was no immediate prospect of an off-airfield landing. I was fully aware of my position over the ground, but with the preoccupation of the fuel state I failed to monitor my vertical relationship to the airspace above. It was only after several minutes that I suddenly realised that the in-panel navigation was displaying that I was several hundred feet above the 4500' base of the LTMA. I immediately cut the engine and commenced a rapid descent to clear the airspace. Factors 1) Preoccupation with the fuel state. 2) A navigation device which is new to me. While I understand the operation of it, I have not had much experience interpreting the display. The display I have used in the past gave a much more robust warning approaching controlled airspace. I have been flying this area for the past 30+ years and am fully familiar and aware of the airspace in this area, and have always avoided infringement. On this occasion I failed to both monitor the airspace above me, and I did not recognise the navigational warning on the instrument in front of me. I am most sorry about this infringement and will ensure that through this experience and increased familiarity with the new instrumentation that it will not happen again.
201509821	18/07/2015	EGTT : London (FIR)	Not specified		D	CTA	EUROPA	Reciprocating	1	Infringement of the Stansted CTA by an unknown aircraft squawking 0013 at 1600ft, resulting in loss of separation with traffic. Aircraft identified as a Europa. Traffic info and avoiding action given.	At approximately 10 45 an aircraft squawking 0013 entered the Stansted CTA at 1,600 ft tracking north west bound. Fltnum 84BA was given avoiding action and traffic information. Int position was then able to call the unknown aircraft squawking 0013 and identify him as Europa. The plane then descending to 1,400ft outside controlled airspace.☐ Supplementary 05/08/15:☐ Avoiding action due to infringing aircraft.
201509821	18/07/2015	EGTT : London (FIR)	Not specified		D	CTA	DE HAVILLAND	Turboprop	2	Infringement of the Stansted CTA by an unknown aircraft squawking 0013 at 1600ft, resulting in loss of separation with traffic. 201509834	21/07/2015	EGTT : London (FIR)	EGLM : White waltham	SE	D	CTR	STEARMAN	Reciprocating	1	Infringement of the London CTR (Class D) by a Stearman B75 squawking 7000. Heathrow departures stopped. Standard separation maintained.	Infringing aircraft London Zone. I was SVFR position when I noticed CAIT alert me to a Stearman B75 infringing the London CTR south of White Waltham. As the aircraft was on a south easterly track I stopped Heathrow southbound departures for 3 minutes. I contacted White Waltham who said they were working it. I told them to instruct the aircraft to track west immediately. The aircraft did not change its track so I recalled White Waltham who said they had given it to Farnborough. I phoned Farnborough, the assistant picked up the phone and so I asked whether the controller was working the Stearman B75. The assistant told me it was on standby and so I told him that it was infringing and maybe they should do something about it.☐ CAA Closure:☐ No action taken. Closed due elapsed time. Registration will be monitored.

201509847	18/07/2015	EGTT : London (FIR)	EGBB (BHX): Birmingham		D	CTR	CESSNA	Reciprocating	1	Infringement of the Birmingham CTR Class D) by a C172 squawking 4361 at 1700ft.	Just prior to this EGBB called to ask whether I was working traffic just to the east of their ATZ squawking 7000. I informed them that I was not. An aircraft then called me saying he was overhead the M69. There were not any contacts over the M69 so I guessed it could be that aircraft. I asked him to squawk 4361 and realised it was that aircraft. He was very close to the EGBB ATZ by this point. I called EGBB and informed them. They asked me to pass him to them on 118.050, which I did.☐ Supplementary 29/07/15:☐ Not sure why the light aircraft infringed airspace. External threats:- Company aircraft behind also given similar instructions and continual ATC confusion of call signs. Wrong direction of turn when avoiding action given. No update on ATC intentions as we believed we where being vectored for final during our second transition of the 33 localiser. Probably would not have started to configure but we where having to second guess ATC who where having callsign issues.☐ Appropriate CAA action is to be taken as a result of this incident.
201509847	18/07/2015	EGTT : London (FIR)	EGBB (BHX): Birmingham		D	CTR	DE HAVILLAND	Turbofan	2	Infringement of the Birmingham CTR Class D) by a C172 squawking 4361 at 1700ft. 201509966	23/07/2015	EGTT : London (FIR)	SAM	12nm NNE	D	CTA	OTHER	Reciprocating	1	Infringement of the Solent CTA 5 (Class D) by an unknown aircraft squawking 0432, believed to be indicating 2800ft - 2900ft. Aircraft identified as a Spitfire. Traffic info and avoiding action given to an inbound DHC8.	Infringement of Solent CTA-5 by Spitfire, DHC8 issued avoiding action. At approximately 1520 I was operating as Solent Radar vectoring DHC8 for ILS 20. The aircraft had turned left base descending out of Alt 4A for Alt 3A. I noticed a 0432 squawk approximately 16NE SAM westbound Alt 2.7A on a track that would infringe CTA-5 and quite fast. I asked the coordinator to phone Farnborough to request it be turned away or transferred to us and started putting out blind calls. Mode S indicated it was a Spitfire. The coordinator advised Farnborough were having problems contacting the aircraft. Given the 0432 was now slowly climbing on the same track, I told the DHC8 to fly 240 degrees to go through the localiser as I believed an infringement was imminent. About 5secs later the 0432 entered, I believe indicating Alt 2.8A-2.9A. I told DHC8 the heading was now an avoiding action heading and the traffic was in their 6 o'clock range of 5miles. The contact then began a right turn to the NW and the coordinator advised that Farnborough had regained contact and were turning it away. I believe 5nm was maintained. I resumed vectoring the DHC8 who landed without further incident. Shortly after the Spitfire called on frequency and advised he was a westbound to display. It was put on a 3661 squawk and the Mode C checked out as in tolerance. Before transferring it south, I advised Spitfire that the aircraft had infringed, a schedule had been given avoiding action and that we would be filing a report. Spitfire said he had had radio problems.☐ Supplementary 01/09/15:☐ NOTI: Avoiding action due to infringing aircraft.

He initially routed towards the West to clear the TMZ then north towards Cambridge. Initially on a basic service, given 5026 squawk and London QNH 1012 (Validated and verified). Folland Gnat requested to climb to 2400ft and for a traffic service, of which I was busy at the time, so climb was approved to 2400ft, but would upgrade the service shortly due to making a phone call. The aircraft in the climb was told he was identified and under a traffic service. The AIW
201510133	25/07/2015	EGTT : London (FIR)	BKY	2nm NE	A	TMA	AIRBUS	Turbofan	2	Folland Gnat climbed to 3100ft instead of cleared altitude 2400ft and infringed the LTMA (Class A), resulting in loss of separation with an inbound Falcon 900. AIW and CAIT activated.	Folland Gnat working Farnborough to 3.1. Folland Gnat working Farnborough level bust up to 3.1, small fast jet. It happened inside the Stansted RMA with inbound traffic A319 at FL90. Folland Gnat popped up right inform of the A319 checked the height readout to make sure we had 5A ft and then answered phone from East, got controller to standby whilst I checked again and the Folland Gnat had descended outside CAS. Subsequently found out the Folland Gnat had bust its level.☐ Supplementary 27/07/15:☐ Airspace infringement near BKY. At 0841z secondary CAIT showed an aircraft (Folland Gnat, 5026 squawk) entering the Stansted CTA, climbing rapidly to 3000'. After only a couple of sweeps of the radar, the aircraft appeared to leave controlled airspace. At the time I was in contact with an aircraft inbound to Luton. It was on a diverging track from Folland Gnat whilst joining the ILS for runway 26 at Luton, however there was less than 5 miles between the 2 aircraft.☐ Supplementary 27/07/15:☐ I was the LARS North controller when Folland Gnat called on frequency at 0837. He initially routed towards the West to clear the TMZ then north towards Cambridge. Initially on a basic service, given 5026 squawk and London QNH 1012 (Validated and verified). Folland Gnat requested to climb to 2400ft and for a traffic service, of which I was busy at the time, so climb was approved to 2400ft, but would upgrade the service shortly due to making a phone call. The aircraft in the climb was told he was identified and under a traffic service. The AIW

201510137	25/07/2015	EGTT : London (FIR)	EGGW (LTN): London/Luton	10nm SW	D	CTR	STAMPE	Reciprocating	1	Infringement of the Luton CTR (Class D) by an unknown aircraft showing as a primary contact only. Aircraft identified as a Stampe SV4. Check all imposed. Traffic info given. Standard separation maintained.	Airspace infringement Luton CTR. At around 0913z a primary contact entered the Luton CTR roughly 10nm southwest of Luton Airport. It triggered the primary CAIT tool. As the contact was heading steadily towards Luton Airport I imposed a "check all" against departing aircraft. I also made some blind calls without any reply and phoned Farnborough LARS to check if they were working it, which they weren't. At around 0917z EMB135 came on frequency expecting vectors for the ILS runway 26 at Luton. I informed the crew to expect some delay due to the unknown aircraft in the Luton CTR. At 0918z I handed over to a colleague but I remained close-by. At 0921z tower phoned to confirm they could see what appeared to be an aircraft out of the VCR windows. At this point the contact appeared to be southeast of the field by about 7nm. Shortly after this tower phoned to ask for a release on a MATCH departure from Luton, call sign GLF4. My colleague denied the request. At roughly 0924z the contact appeared to leave the Luton CTR to the southeast of Luton Airport. After the infringement, my colleagues tracked the contact and believe the aircraft to be a Stampe SV4. This information was gathered from both Southend Radar and the air traffic workers at Stampe SV4 destination.☐ Supplementary 29/07/15:☐ Single pilot operation VFR planned. Errors made in identifying ground features together with over allowance of drift made for strong northerly winds and difficulty reading compass due moderate turbulence caused increased workload. Track was adjusted to return clear of CTR. Difficulty in maintaining good control of aircraft meant no call was made to D&D on 121.5.
201510137	25/07/2015	EGTT : London (FIR)	EGGW (LTN): London/Luton	10nm SW	D	CTR	EMBRAER	Turbofan	2	Infringement of the Luton CTR (Class D) by an unknown aircraft showing as a primary contact only. 201510143	25/07/2015	EGTT : London (FIR)	Near Leighton Buzzard				EUROPA	Reciprocating	1	Infringement of the Luton CTA (Class D) by an aircraft squawking 7000 at 3000ft. Standard separation maintained.	At about 1055z I noticed an aircraft with 7000 squawk, showing 3600' mode C, heading towards Luton controlled airspace. Mode S data showed the call sign. It then entered controlled airspace descending to 3000'. I made a blind call and the aircraft was listening out on frequency. I asked whether they were anything to do with the Dunstable Gliding Club/competition to which they answered no, therefore it was clear this was unknown/lost traffic. I therefore quickly got the details and identified it to become known traffic. I informed him that he was inside controlled airspace and to descend to be not above 2400'. The aircraft left frequency at 1104z when it contacted its destination. ☐ Supplementary 28/07/15:☐ Was using Mode S and was tuned and listening to Luton controller well in advance. There were numerous glider contacts in the area and immediately N of the CTA. In fairly turbulent conditions we both became pre occupied with looking out for glider traffic keeping a watchful eye on several gliders in our vicinity. We received the expected airspace warning and had anticipated descending. However only the 3500 warning was seen on the GPS. We immediately descended to 3000 before entering the zone unaware at the time that there was also a 2500 CTA ahead. I believe both alarms were accepted using the touch screen in turbulent conditions. Immediately after entering the zone at 3000 on our current QNH we were contacted by Luton controller and informed we were inside the 2500 CTA. We immediately descended to 2200 feet and apologised. We continued the with a squawk a! and basic service from Luton until clear of the CTA. Needed to take more care in noting the
201510146	25/07/2015	EGTT : London (FIR)	Colwyn Bay		A	Airway - ATS Route	PIPER	Reciprocating	1	Infringement of Airway L975 by a PA28 squawking 1177.	I had been working as the 2nd FISO (planner) since approx. 0910, all 3 frequencies were band-boxed but traffic levels were increasing.☐ PA28 had been on frequency since 0917. Outbound from EGBJ he was routing up to Colwyn Bay to coast out en route to EGNS. Flying at FL60, he reported an estimate for Colwyn Bay of 1005. At around 0935 traffic levels increased to the extent that we split the frequencies, and I took 125.475 and 124.750, FIS North and West. My colleague then said to 'keep an eye' on PA28 as he might be heading for the part of L975 where the base is FL45. I immediately told the a/c to Remain Outside CAS and he acknowledged that he would. Again my colleague said it looked likely that a/c might be a bit close to CAS and again I told a/c to ROCAS. I explained that the base of CAS north of the Eastern part of Colwyn Bay was FL45 and again he responded that he would remain clear. My colleague then took a phone call from the Scottish WAL Planner, who reported a/c was in CAS, and yet again I told a/c that a RADAR controller reported he was likely to infringe CAS, pilot responded by saying he was remaining clear. My colleague then phoned WAL controller to ask if he would work a/c. Controller declined saying he was too busy and he didn't really have anything to affect. The a/c then appeared to turn West and the WAL controller agreed. However a/c then seemed to turn back on Northerly heading and my colleague phoned WAL Controller again, who still declined to work a/c but recommended he descend to FL44. I told a/c that WAL Controller requested that he descend to FL44 and a/c responded that he was descending. A/c was then transferred to EGNS at 1003.☐

201510149	22/07/2015	EGTT : London (FIR)	Dunstable Downs	2nm N	D	CTR	CESSNA	Turboprop	1	Infringement of the Luton CTR (Class D) by an unknown aircraft squawking 7000. Aircraft identified as a C208. Check all placed. Standard separation maintained. Pilot misidentified chart.	Infringement - Luton CTR - C208. I observed a A7000 squawk approaching the Luton CTR a quite high speed from the north. I checked the Mode S FLID and established the callsign was C208. I made blind transmissions but got no response. I had previously released B737 on an SDR Juliet which would come into conflict with the now infringing aircraft. I asked the tower to stop B737 which they did and vacated the aircraft. I also placed a check all requirement on the tower. C208 entered the Luton CTR north of Dunstable Downs in an area of numerous gliding contacts and tracked south into the CTR before turning through east to northbound leaving the CTR towards Cranfield. I phone Cranfield ATC who confirmed they were working C208 and I allocated a discrete squawk 4676 to confirm the identity.☐ Supplementary 27/07/15:☐ When flying in the UK, there is obviously a lot of controlled airspace adjacent and overlapping each other. As such, the airspace visual advisory feature is continuously alerting therefore rendering it nearly unusable for effective identification and prevention of penetration of proximate to controlled airspace. Prior to conducting a VFR demonstration flight in the local area of EGTC, I reviewed the airspace on my Jeppesen VFR chart. I recognized the airspace at both Dunstable Downs glider port as well as EGGW. My error however, was that I thought the airspace vertical limits of the location I infringed was SFC-1500 feet. Being at 3000 feet, I thought I was clear of the airspace when obviously I was not. At no point during the flight was I advised by ATC that I infringed on Luton's airspace. It was only after I landed that the people I was showing the airplane to were advised by the

201510152	25/07/2015	EGTT : London (FIR)	Cookham/Maidenhead		D	CTR	RHEIN	Turboshaft	1	Infringement of the Heathrow CTR (Class D) by an unknown aircraft squawking 7000, indicating 900ft. Aircraft identified as a R66. CAIT activated. Standard separation maintained.	R66 infringe Heathrow. At approx. 1135z an unknown contact entered CAS North of White Waltham tracking ESE, squawking 7000 and indicating 900'. CAIT showed the callsign as R66. Heathrow were departing 27, there was one aircraft in the vicinity but it was 5000' above and climbing. I made a blind transmission while the Thames Radar controller called White Waltham. White Waltham were unaware of the aircraft, I made one last blind transmission, instructing the aircraft to track West to leave the zone, as I went to stop Heathrow departures. The aircraft turned immediately hard right and left the zone between 700 and 900 feet, tracking along the Northern edge of Maidenhead. Given the short distance to run to leave CAS I did not stop Heathrow departures. The aircraft subsequently squawked Farnborough Radar 0432, and they confirmed the details.
201510157	25/07/2015	EGTT : London (FIR)	SAM	12nm NNE	D	CTA	AVIONS ROBIN	Reciprocating	1	Infringement of the Solent CTA 5 (Class D) by an unknown aircraft squawking 0011, indicating 2900ft. Aircraft identified as a DR400. AIW activated. Standard separation maintained.	Infringement of Solent CTA area 5 by DR400. I was operating as OJTI at the time of the infringement with the trainee working heavy traffic loading. At approximately time 1410 my ATSA pointed out a 0011 squawk approaching the CTA area 5 indicating 2900 feet. It entered controlled airspace, setting off the AIW. Mode S showed the contact to be DR400 who had called prior to the infringement for a Basic Service, but had not requested a transit. I asked the aircraft to squawk 3670 (no reply) and my trainee also tried to get the pilot to squawk 3670 (which the pilot did not do). The trainee told the pilot that he was inside of controlled airspace without a clearance - the pilot replied he was remaining outside at 2800 feet. My trainee explained that the base of controlled airspace was 2500ft in that position. No other aircraft were affected by the infringement.
201510361	23/07/2015	EGTT : London (FIR)	Burford	2nm E	D	CTR	PIPER	Reciprocating	1	Infringement of the Brize Norton CTR (Class D) by a PA32 at 2800ft. Standard separation maintained.	CTR infringement PA32. I was working as the RA Controller whilst bandboxed with Zone. I had several departures and Zone transits on frequency and was in the process of splitting the console and handing the Zone position over. PA32 called with approximately 2nm to run to the Northern CTR Boundary, just to the East of Burford. I instructed the ac to remain outside CAS and to standby as I had several other tasks to complete. The ac continued on his track (SSW) and entered the CTR. I suggested a northerly track to clear CAS as the ac hadn't been positively identified at the time. The ac was subsequently identified by the Zone controller and was issued a squawk of 3701. The ac was approximately 1.5nm inside the CTR when they turned Northbound.☐ Supervisors Narrative:☐ I was fully aware that traffic levels were increasing and had instructed the Zone controller to be in position and take this task from the RA controller. In this process PA32 had called and was instructed to remain outside CAS. This instruction was not initiated resulting in the unauthorised penetration of the Brize CTR. The handover of the Zone task from RA to the Zone controller had no effect on this occurrence. Even without the instruction to remain outside CAS the Air System failed to ensure he remained outside CAS before receiving a positive ATC clearance.

201510364	25/07/2015	EGTT : London (FIR)	EGVN (BZZ): Brize norton		D	CTR	PIPER	Reciprocating	1	Infringement of the Brize Norton CTR (Class D) by an unknown aircraft squawking 1177 climbing to 2900ft. Aircraft identified as a PA32.	CTR infringement. I was the LARS controller working a single basic service track. I noticed a track approaching the edge of Brize CTR wearing a 1177 (FIS) Squawk. I observed its track and pointed it out to the approach controller who was also watching the aircrafts progress. The mode Charlie indicated 023 and climbed. It looked as though the aircraft was trying to climb over the CTR but the mode Charlie stopped at 029 and the aircraft entered Brize CTR at Brize 277 degrees 9 miles and transited through the Zone before leaving at Brize 256 degrees 9.9 miles. There was no traffic to effect. I called London Flight Information Service (FIS) and requested traffic information, I was told it was being worked by their agency and they asked if I wanted to work it which I declined as it had already left Brize CTR. I told the controller the aircraft had entered the CTR and they asked if I was going to file to which I replied that I was. They informed me of the Callsign PA32.
201510468	27/07/2015	EGTT : London (FIR)	Danger Areas EG D123 and EG D125	Imber/Larkhill	G	Danger area	OTHER	Reciprocating	1	Infringement of Danger Areas EG D123 (Imber) and EG D125 (Larkhill) by an aircraft squawking 7000 at 2100ft.	I was the duty Deputy Training Safety Officer on the afternoon of Mon 27th Jul 2015. At about 1340 local I observed a 7000 squawk enter EDG D125 in the area just to the west of Netheravon at 2100ft AMSL (a marked parachuting airfield) heading on a westerly track at a speed of 59kts. I immediately telephone SPTA ground operations to request a safety check fire (EGD D125 was notified as active to 30,000ft AMSL) as the aircraft was on course to enter the live firing area of EDG D125. Fortunately, I was informed that firing had just ceased so no check fire was actually required. I was also informed that Warminster Danger Area (WDA) had also completed firing. The aircraft continued to fly towards the village of Tilishead whereupon it entered EDG D123, notified as active to 3,000ft. I was able to observe the aircraft as it flew towards Tilishead as the Salisbury Operations office is located nearby. It then turned northwest to exit EGD D123 in the area of Bratton at 1354. I tracked the 7000 as it continued north/northwest but the squawk disappeared in the area to the west of Lyneham (disused). At no point did the aircraft speak to Salisbury Air Operations on the published Danger Area frequency 122.75. I replayed a recording of our SSR feed to endeavour to establish were the aircraft may have originated from and was able to discover that he had been in contact with Farnborough LARS as he had been squawking 0430. Farnborough were able to inform me of the probable aircraft details and registration number and that he had departed from Redhill and was routing towards Bristol. I spoke with Redhill and they confirmed the registration & provided me with the pilot's contact details. Having managed to trace the pilots
201510478	22/07/2015	EGTT : London (FIR)	EGGP (LPL): Liverpool	10nm South East	D	CTR	EVEKTOR AEROTECHNIK	Reciprocating	1	Infringement of the Liverpool CTR (Class D) by an aircraft squawking 7000 and indicating 1200ft. Standard separation maintained.	7000 squawk observed entering the Liverpool CTR approximately 10nm south east of Liverpool Airport indicating altitude 1200'. The aircraft routed westbound for about 4 miles before turning southeast and leaving the zone. Manchester ATC were able to use their Mode S to provide us with the registration of the aircraft, which was recognised by one of the Liverpool ATC staff as being based at Barton Aerodrome, although whether the flight had originated from there is unknown. Type also unknown. Blind call made on the approach frequency in case the crew were listening out, but to no avail. No other aircraft were affected. Weather conditions were good.
201510488	30/07/2015	EGTT : London (FIR)	MIRSI	Bearing 100 Range 4nm	D	CTR	PIPER	Reciprocating	1	Possible infringement of the Manchester CTR (Class D) by a PA28 observed climbing 2000ft. Traffic info and avoiding action given.	At about 14:33 an AIW was observed north end of LLR 1.7 climbing 2000ft. I instructed aircraft approaching MIRSI to continue heading ?024 to avoid the AIW. PA28 responded to my call for info on the traffic, was identified and advised that he may have infringed CAS before leaving my frequency for Warton Radar. I was too busy to recall/record further information.□ Supplementary 14/08/15:□ The aircraft was on a flight via the Low Level route. The aircraft was crewed by two Pilots, an Instructor in the right hand seat, the qualified pilot in the left had seat was the Captain for this flight. There was one passenger in the back. The aircraft tracked 360 deg northwards up the low level route and when 2 miles north of the M62, turned left to track 330 deg. Haydock racecourse was positively identified on the left of track, and when the racecourse was assessed as 2 miles astern, and with the aircraft on the northern boundary of the route, a climb was commenced aiming to remain under the area of controlled airspace D, lower boundary 2,500ft. At this time the Manchester controller asked 'aircraft at northern end of low level route to identify itself'. The Instructor responded and reported that we were outside the northern end of the route. The controller advised that he believed PA28 was in controlled airspace and an immediate descent was initiated. The aircraft was given a new squawk. No further communication was held with the Manchester controller until changing frequency to Warton at a position north west of Burscough. At this point a simple frequency change was requested and acknowledged by the Manchester controller. Both Pilots believed that they
201510488	30/07/2015	EGTT : London (FIR)	MIRSI	Bearing 100 Range 4nm	D	CTR	UNKNOWN	Unknown		Possible infringement of the Manchester CTR (Class D) by a PA28 observed climbing 2000ft. 201510499	29/07/2015	EGTT : London (FIR)	Not specified		G	Danger area	PIPER	Reciprocating	1	Infringement of active Plymouth Danger Areas by a PA28 at 5000ft.	Aircraft infringed active Plymouth Danger Areas. At 1224z aircraft PA28 came on frequency requesting basic service and gave position report of 15m south of coast. When I questioned which 'coast' they were south of, e.g. BHD, the reply was yes BHD. I asked the pilot to squawk 1177 and requested which point the aircraft would be coasting in, the reply was St Austell. I quickly checked on the map, and believed on that track the aircraft would cross the Plymouth Danger Areas, which I confirmed on the SIS were active. At the same time I observed a 1177 squawk within the Plymouth Danger areas and informed the pilot that all of the DAs were active. The pilot responded that she had been told that they were not active as activity had been cancelled. I rang Plymouth Military though the line was dropped, I believe because they started to ring the FIS. When contact was made with Plymouth Mil, we exchanged information about the aircraft and they confirmed that the Danger Areas were all active with live firing. I was asked to tell the aircraft to turn and leave the Danger Areas, so I said that I would transfer the aircraft to their frequency 121.25 asap as I was unable to instruct the pilot. Aircraft was transferred to 121.25 at 1227z. I recontacted Plymouth Military after a few mins to allow them to take details from the pilot. They had been told by the pilot that previous sector had informed her that DAs were not active, Ply Mil confirmed that they would be filing a report against her. I spoke to previous sector ATC who confirmed that they had information that the Plymouth Danger Areas were active and they would have told the pilot this, their procedure was to transfer such aircraft to Plymouth Military in this situation and not to FIS.
201510501	27/07/2015	EGTT : London (FIR)	EGSS (STN): London/Stansted	8mn NNE	D	CTA	PIPER	Reciprocating	1	Infringement of the Stansted CTA (Class D) by an unknown aircraft squawking 7000. Aircraft identified as a PA28. Traffic info given. Standard separation maintained.	PA28 infringing Stansted CTA. I was working as Stansted Final director working B737 inbound. I spotted a 7000 squawk indicating 20 pointing towards the CTA and had a feeling it was about to infringe. When it did infringe, INT and I both made blind transmissions to PA28 (from mode S) but to no avail. B737 was on right base for RY22 so the best course of action was to continue through the localiser and pass T1 on the infringing aircraft. I tried another blind transmission and was able to make contact with the aircraft, identify it and continue B737's approach.
201510501	27/07/2015	EGTT : London (FIR)	EGSS (STN): London/Stansted	8mn NNE	D	CTA	BOEING	Turbofan	2	Infringement of the Stansted CTA (Class D) by an unknown aircraft squawking 7000. Aircraft identified as a PA28. Traffic info given. Standard separation maintained.	PA28 infringing Stansted CTA. I was working as Stansted Final director working B737 inbound. I spotted a 7000 squawk indicating 20 pointing towards the CTA and had a feeling it was about to infringe. When it did infringe, INT and I both made blind transmissions to PA28 (from mode S) but to no avail. B737 was on right base for RY22 so the best course of action was to continue through the localiser and pass T1 on the infringing aircraft. I tried another blind transmission and was able to make contact with the aircraft, identify it and continue B737's approach.
201510526	28/07/2015	EGTT : London (FIR)	EGKK (LGW): London/Gatwick	CTA	D	CTA	PIPER	Reciprocating	1	Infringement of the Gatwick CTA (Class D) by a PA28 squawking 3767 at 1700ft. ATC broke an inbound B747 off approach to R/W26L. Traffic info given. Standard separation maintained.	PA28 infringed NE corner of CTA tracking SE. PA28 infringed NE corner of the CTA tracking SE. The aircraft was on a 3767 squawk and went up to 1.7A, I broke off the B747 and gave traffic and stopped the B737 at 6A and got him to take up an orbit. The PA28 then turned off their transponder so it was primary only. I rang Redhill and they said that they had gave it to Farnborough, I rang them and they had him squawking 1730 just as he was leaving CAS.
201510526	28/07/2015	EGTT : London (FIR)	EGKK (LGW): London/Gatwick	CTA	D	CTA	BOEING	Turbofan	4	Infringement of the Gatwick CTA (Class D) by a PA28 squawking 3767 at 1700ft. ATC broke an inbound B747 off approach to R/W26L. Traffic info given. Standard separation maintained.	PA28 infringed NE corner of CTA tracking SE. PA28 infringed NE corner of the CTA tracking SE. 201510550	02/08/2015	EGTT : London (FIR)	SAM	11.5nm NNE	D	CTA	VANS	Reciprocating	1	Infringement of the Southampton CTA 5 (Class D) by an unknown aircraft squawking 7000, indicating 3000ft. Aircraft identified as a Vans RV6. Traffic info given. Standard separation maintained.	Vans RV6 - Infringement of CTA. 7000 squawk observed abeam Popham tracking SE bound, indicating A030. Several blind calls made with no response, no mode S. Two inbounds advised of unknown and that I may need to vector them to the west of the airfield. Eventually on about the 5th time of making blind calls, as the unknown enter CAS (CTA-5), Vans RV6 responds. He was allocated squawk 3670 and reported at A025. The unknown was identified as Vans RV6 who was then cleared to transit CAS not above A025. No loss of separation.

201510552	31/07/2015	EGTT : London (FIR)	SAM	14nm S	D	CTA	CESSNA	Reciprocating	1	Infringement of the Solent CTA 2 (Class D) by an unknown aircraft squawking 7000 at 2300ft. Aircraft identified as a C150. The C150 left CAS but subsequently infringed the same airspace again at 3700ft. Traffic info given. Standard separation maintained.	Infringement of Solent CTA - 2. A 7000 contact was observed tracking west bound indicating 2.2A. It went up to 2.3A and continued west subsequently infringing the Solent CTA - 2. It turned and left CAS. It then popped up as a Farnborough squawk 0434 and tracked east infringing the same airspace again at 3.7A. Farnborough were phoned and details of the a/c were taken as C150.
201510555	30/07/2015	EGTT : London (FIR)	EGSS (STN): London/Stansted	10nm NNE	G	Restricted area	ISAACS	Reciprocating	1	Infringement of the Stansted TMZ (Class G) by an unknown aircraft squawking 7000 with no Mode C. Aircraft identified as an Isaacs Fury. Traffic info given.	TMZ infringement. At approximately 1550 an unknown contact was observed squawking 7000 with no mode C entering the Stansted CTA in TMZ 1. B737 was given a turn away from the unknown and given traffic information. The unknown was observed to change squawk and be identified by Southend Radar as an Isaacs Fury.
201510555	30/07/2015	EGTT : London (FIR)	EGSS (STN): London/Stansted	10nm NNE	G	Restricted area	BOEING	Turbofan	2	Infringement of the Stansted TMZ (Class G) by an unknown aircraft squawking 7000 with no Mode C. Aircraft identified as an Isaacs Fury. Traffic info given.	TMZ infringement. At approximately 1550 an unknown contact was observed squawking 7000 with no mode C entering the Stansted CTA in TMZ 1. B737 was given a turn away from the unknown and given traffic information. The unknown was observed to change squawk and be identified by Southend Radar as an Isaacs Fury.
201510562	01/08/2015	EGTT : London (FIR)	EGSS (STN): London/Stansted	TMZ 1	G	Restricted area	STEARMAN	Reciprocating	1	Infringement of the Stansted TMZ 1 (Class G) by an unknown aircraft showing as a primary contact only. Aircraft identified as a Stearman. Standard separation maintained.	TMZ 1 Infringement. Working FIN boxed. At time 1640 I observed a primary target in TMZ 1 heading NW. B737(1) was heading 310 descending to 5000 and B737(2) heading 035 descending to 6000. I gave both aircraft new headings to vector around the target. At approx.1643 the target disappeared from radar, and after a moments monitoring with the GS A beside me I decided to position B737(1) back to the centreline. Shortly after the primary returned. I advised B737(1) of this and that I'd have to reposition. He said he was good VMC and would keep a good look out. I confirmed he was happy to continue an approach whilst looking out and the pilot was very happy to do so. B737(2) was vectored behind. I called TOWER to explain the interesting approaches. They could see the aircraft and believed it to be a Piper Cub. I tracked the primary to its destination and called ATC there at 1653. They confirmed they had a Stearman on base leg, which matched with my observation on radar. They gave the aircraft details.

201510565	01/08/2015	EGTT : London (FIR)	EGMC (SEN): Southend	CTA 7	D	CTA	BEECH	Reciprocating	1	Infringement of the Southend CTA 7 (Class D) by an unknown aircraft squawking 1177 at 2900ft. Aircraft identified as a BE33. Standard separation maintained.	Southend Controlled Airspace infringement. Traffic observed tracking northwest bound entering Southend towards CTA7 squawking 1177 at 2900' indicated on mode C. London FIR South contacted by landline and the aircraft entered CTA7. BE33 was transferred to Southend radar on 130.775MHz, identified inside CTA1 and given retrospective clearance to cross at 2500' VFR on track LAM. Pilot was informed via R/T that he had entered Controlled Airspace.
201510584	02/08/2015	EGTT : London (FIR)	EGLC (LCY): London city	Bearing 060 Range 5nm	D	CTR	PIPER	Reciprocating	1	Infringement of the London City CTR (Class D) by a PA28 squawking 7000 at 2300ft.	I was the Thames radar controller and at approximately 1738 I was alerted by CAIT to a zone infringement NE of EGLC at 2300ft squawking 7000 (tracked to EGTR and identified), Saab2000 had departed and was level at 4000ft and 2nm north of infringing aircraft at the time it entered controlled airspace. No avoiding action was taken as the a/c were diverging at the time.
201510584	02/08/2015	EGTT : London (FIR)	EGLC (LCY): London city	Bearing 060 Range 5nm	D	CTR	SAAB	Turboprop	2	Infringement of the London City CTR (Class D) by a PA28 squawking 7000 at 2300ft.	I was the Thames radar controller and at approximately 1738 I was alerted by CAIT to a zone infringement NE of EGLC at 2300ft squawking 7000 (tracked to EGTR and identified), Saab2000 had departed and was level at 4000ft and 2nm north of infringing aircraft at the time it entered controlled airspace. No avoiding action was taken as the a/c were diverging at the time.
201510587	01/08/2015	EGTT : London (FIR)	CLN		A	TMA	CIRRUS	Reciprocating	1	Infringement of the LTMA (Class A) by an unknown aircraft squawking 4575 at 5600ft and climbing. Aircraft identified as a SR22. CAIT activated. Standard separation maintained.	Infringer at CLN. SCAIT activated at CLN showing a 4575 squawk (SR22 on Mode S) at altitude 5600 feet and climbing. I vectored two Abbot arrivals around the infringer and kept them high. No LOS occurred. The infringer was seen to climb to altitude 6600 feet tracking north and left CAS north of CLN.

201510602	02/08/2015	EGTT : London (FIR)	MCT	13nm SW	D	CTR	PIPER	Reciprocating	1	Infringement of the Manchester CTR (Class D) by an unknown aircraft squawking 7000, indicating 2500ft. Aircraft identified as a PA28. Standard separation maintained.	Zone infringement PA28. On duty as Approach South I was aware of a 7000 squawk approaching the zone from the south indicating 2500'. As it became clear that the contact would enter, or come close to entering CAS, both FIN DIR and myself attempted to call the aircraft using the callsign derived from the aircraft's Mode S readout. No reply was received and the contact entered CAS in the vicinity of Winsford at 2500'. The aircraft then responded to a call and was instructed to squawk a Manchester code and to descend to 1300' or below. I confirmed that the pilot was sure of his position - which he was. I informed the aircraft that he had infringed CAS. Manchester traffic was not affected by the infringement
201510605	01/08/2015	EGTT : London (FIR)	EGSS (STN): London/Stansted	Bearing NE Range 10nm			CYCLONE AIRSPORTS	Reciprocating	1	Reporter has raised concerns around poor airmanship displayed.	This observation has been raised by two controllers who both talked to this aircraft on Essex radar across two frequencies over the course of approximately 30 minutes. Aircraft departed for a site south of Southend. During the course of the half an hour or so we were jointly concerned as to his ability to communicate and navigate effectively across the airspace surrounding Stansted. We tried our best to help the pilot who seemed disorientated at times both in his navigation and his general RT. We found it unsettling that someone may choose to fly if they do not have confidence in their abilities and felt an observation was worth submitting in the hope that if there is an established channel the pilot could be contacted and may choose to re-affirm some of his basic skills before commencing a flight across busy airspace in the future. The general problems which were encountered and should be clear on the radar replay and tapes was a late call to request a transit resulting in a minor infringement, unfamiliarity with the equipment on board, becoming temporarily lost, and persistently not replying or reading back important instructions correctly. The pilot eventually elected not to continue to his intended destination as he felt he did not have enough fuel to complete his flight. Whilst we were more than happy to help the pilot given the situation and were pleased that he eventually landed safely at Rayne, we would like to think that the whole flight could have been conducted much more effectively through better airmanship. Luckily the sector and ops room was quiet at the time and we were able to help the pilot, but in the future it may be the case that we wouldn't be able to give him as much attention as was
201510800	05/08/2015	EGTT : London (FIR)	ABBOT		A	TMA	AVIONS ROBIN	Reciprocating	1	Infringement of the London TMA (Class A) by a DR40 squawking 6177 (initially 7000) at 4100ft. Traffic info and avoiding action given. Separation lost.	I was working on SS FIN when I observed a A7000 squawk in a left hand orbit just south west of ABBOT. He was climbing. He then entered CAS and reached 4100 feet. B737 was on a left base for R22 within 5 miles of the infringer but going away. I simply turned him onto final approach and cleared him for the ILS. There was no point in issuing him avoiding action. A319 however was down wind right hand for R22. I initially stopped his descent at 6000 feet and turned him east while trying to work out what the infringer's intentions were. Infringer then put on a Cambridge squawk and tracked north. I gave A319 avoiding action and never lost 5 mile. Supplementary 05/08/15: A/C on 7000 observed near ABBOT indicating 4100. His squawk changed to 6177 once inside CAS. B747 level at FL80 was given avoiding action to increase separation. Supplementary 06/08/15: I had booked a 1600hrs (local) training slot for RNAV approach to destination followed by two NDB holds to the ILS runway 23. Departed from a private site at 15.40 and contacted Cambridge on 123.60 at 15.45 to say inbound for the training flight estimating the CAM in 10 minutes. Advised by Cambridge that I was now under a procedural service and to climb to 4000' on 1011, but to remain 10 minutes (not miles) from the CAM. As I was at that time 10 minutes away and under a procedural service, I orbited in my position to await clearance to continue. After one orbit I was cleared direct to GOPOD at 4000' for the RNAV approach and to remain clear of controlled airspace (it was too late for that instruction as they had already

201510838	07/08/2015	EGTT : London (FIR)	MCT	Bearing 315 Range 15nm	D	CTR	PIPER	Reciprocating	1	Infringement of the Manchester CTR (Class D) by a PA28 squawking 7000 indicating 1600ft. Traffic info given.	I became aware of a 7000 squawk indicating 1600' altitude, in the Wigan area and tracking towards Barton. If it continued at current level and track, it would just cut the corner of the LLR / Barton LFA junction and infringe CAS. Mode S showed the registration- I called but the aircraft was not on frequency. I telephoned Barton, who confirmed the aircraft had just called them, and I requested they get the pilot to descend to 1300' or below if continuing on his present track. Moments later the aircraft entered CAS, still indicating 1600' altitude. I passed essential traffic information to a VFR survey flight operating in the vicinity (2 miles east of the infringer, about 800' above but tracking towards) and updated that traffic information when the aircraft were about a mile apart. Moments later the aircraft left CAS into the Barton LFA and the situation was resolved. There were no IFR flights in the vicinity therefore no loss of separation occurred. (I subsequently advised Barton that I would be taking reporting action: they replied that the pilot had earlier been squawking 7600 (R/T fail) on the same flight).
201510838	07/08/2015	EGTT : London (FIR)	MCT	Bearing 315 Range 15nm	D	CTR	UNKNOWN	Unknown		Infringement of the Manchester CTR (Class D) by a PA28 squawking 7000 indicating 1600ft. Traffic info given. (I subsequently advised Barton that I would be taking reporting action: they replied that the pilot had earlier been squawking 7600 (R/T fail) on the same flight).
201510844	07/08/2015	EGTT : London (FIR)	BRI	Bearing 035 Range 4nm	D	CTR	PIPER	Reciprocating	1	Infringement of the Bristol CTR (Class D) by a primary contact at 2300ft. All inbounds put on hold.	A primary contact was observed 8NM ESE of the airfield at 0615, believed to be outside controlled airspace below the CTA I informed the tower ATCO of this traffic and the fact it was not communicating . At this stage there was no reason to blind call it as this a common occurrence and in conjunction with MATS pt1. Soon after it disappeared ,but at 0622 it appeared to appear inside CAS at the Ashton court balloon site , whilst a launch of 130+ was taking place. All inbounds were put to the hold awaiting it's departure from the area. Blind calls were made but no response received. Balloon pilots in the area were asked en masse to try to identify the aircraft and photograph it. One Balloon reported it might be a kitfox, but soon after the aircraft was identified as highly probably a J3C Cub. The aircraft was observed again on primary at 0628 and in the next few minutes moved away to the northeast eventually disappearing from primary radar cover 11NM ENE of the BRI. At approximately 0633 arrivals were vectored for landing as the aircraft appeared to have left the area.☐ CAA closure:☐ Appropriate CAA action is to be taken as a result of this incident.
201510847	07/08/2015	EGTT : London (FIR)	WAL	4nm North West	D	CTA	OTHER	Turboshaft	1	Infringement of the Liverpool CTA (Class D) by a Gyrocopter squawking 5050 at 2400ft.	A Gyrocopter squawking 5050 was under a Basic Service with Liverpool Radar. Aircraft was instructed to remain outside controlled airspace.☐ Aircraft observed at altitude 2400ft 4nm north west of WAL VOR in Liverpool CTA2. No traffic effected. Weather CAVOK

201510854	07/08/2015	EGTT : London (FIR)	EGCC (MAN): Manchester/Intl	Bearing 005 Range 25nm	A	TMA	FLY BUY ULTRALIGHTS	Reciprocating	1	Infringement of the Manchester TMA (Class A) by a Microlight squawking 7000 indicating 4000ft. Check imposed for Northbound departures.	Aircraft infringed the Manchester TMA about 25nm north of EGCC. Transponder indicated A40, squawking 7000. (Identified by Mode S). Aircraft tracked East South-East for about 15nm then lost radar contact. Check imposed for Northbound departures for around ten minutes
201510857	08/08/2015	EGTT : London (FIR)	EGNR : Hawarden		A	Airway - ATS Route	EUROPA	Reciprocating	1	Infringement of the Airway near Hawarden of an aircraft squawking 7000 at 3600ft.	I was on duty as the approach controller. I noticed a 7000 squawk heading towards controlled airspace at 3600ft and made blind calls on the frequency to which there was no response. An aircraft had been calling me previous to this but the transmission was unreadable so I told him to call me again in five miles. I tried to ascertain if this 7000 squawk was the same aircraft. I managed to make 2 way contact and the aircraft replied it was not him in the stated position. The aircraft then called me again at which point he was readability 5. I asked him again his position and deduced that it was him inside controlled airspace. I suggested he descend immediately and I positively identified him. I advised Liverpool radar who said they had nothing to affect.
201510862	08/08/2015	EGTT : London (FIR)	EGSC (CBG): Cambridge	ATZ	G	ATZ	ROBINSON	Reciprocating	1	Infringement of the Cambridge ATZ (Class G) by an unknown aircraft indicating 1700ft, squawking 7000. Aircraft identified as a R44. Traffic info given.	ATZ infringement. Whilst conducting my duties as Cambridge radar at approximately 14:25z I witnessed an aircraft displaying squawk code 7000 and indicating 1700' transit through the Cambridge ATZ. Cambridge tower were very busy at the time and were holding traffic in the overhead at 2000' who became adjacent to the infringing aircraft. Broadcasts were made on both Cambridge tower and Cambridge approach frequencies in order to see if the aircraft was listening out but we received no reply. The aircraft was observed by the tower controller as a R44 helicopter. Essex radar assisted me using their mode s to identify the aircraft as R44 and this was later corroborated by Lakenheath as the aircraft called and was positively identified by them. ☐ Appropriate CAA action is to be taken as a result of this incident.
201510862	08/08/2015	EGTT : London (FIR)	EGSC (CBG): Cambridge	ATZ	G	ATZ	UNKNOWN	Unknown		Infringement of the Cambridge ATZ (Class G) by an unknown aircraft indicating 1700ft, squawking 7000. Aircraft identified as a R44. Traffic info given.	ATZ infringement. Whilst conducting my duties as Cambridge radar at approximately 14:25z I witnessed an aircraft displaying squawk code 7000 and indicating 1700' transit through the Cambridge ATZ. Cambridge tower were very busy at the time and were holding traffic in the overhead at 2000' who became adjacent to the infringing aircraft. Broadcasts were made on both Cambridge tower and Cambridge approach frequencies in order to see if the aircraft was listening out but we received no reply. The aircraft was observed by the tower controller as a R44 helicopter. Essex radar assisted me using their mode s to identify the aircraft as R44 and this was later corroborated by Lakenheath as the aircraft called and was positively identified by them. ☐ Appropriate CAA action is to be taken as a result of this incident.
201510863	07/08/2015	EGTT : London (FIR)	Not specified		A	Airway - ATS Route	ECLIPSE AVIATION	Turboprop	1	Infringement of Airway L9 (Class A) by an aircraft squawking 5066 observed climbing to FL078. Traffic info given. Standard separation maintained.	Aircraft called climbing to FL080 southbound but turning to remain outside of our airspace. I instructed the aircraft to remain outside CAS whilst I coordinated. I then saw that an aircraft on Bristol squawk 5066 climbing into L9 immediately east of Bristol's CAS. Base level is FL075 and the aircraft was passing FL073. I instructed the aircraft to descend FL070. The aircraft climbed to FL078 before descending to FL070. I believe the aircraft entered the airway for approximately 1nm before leaving the southern boundary of L9 although the mode C was unverified.☐ An E145 inbound from the east was passing FL120 at the time cleared to FL080. RAD1 was advised of the potential infringer during the coordination and stopped the inbound descent at FL090. The infringer was given traffic information on the E145. The pilot later advised that he had thought he was clear of L9 but would contact ATC with his details so we could forward him an infringement questionnaire.☐ Supplementary 09/08/15:☐ Planned route was south through Bristol controlled airspace via overhead of EGHS then through the Portland Danger areas D021 and D023 as they were inactive. It took longer than I had hoped to contact Bristol to obtain crossing clearance through their airspace due to other radio transmissions so I turned on to a heading of 155 to avoid Bristol controlled air space and just entered the base of airway L9.

201510863	07/08/2015	EGTT : London (FIR)	Not specified		A	Airway - ATS Route	EMBRAER	Turbofan	2	Infringement of Airway L9 (Class A) by an aircraft squawking 5066 observed climbing to FL078. 201510898	07/08/2015	EGTT : London (FIR)	Dunstable	2nm N	D	CTR	DIAMOND	Reciprocating	1	Infringement of the Luton CTR by an unknown aircraft squawking 0013 at 2000ft, resulting in a loss of separation. Aircraft identified as a DA40.	Whilst controlling on Luton INT I observed an unknown aircraft squawking 0013 enter the Luton CTR north of Dunstable without a clearance. I called the aircraft and instructed the pilot to turn northbound. The pilot apologised for the infringement, stating that he'd misread the chart. Separation was lost against an inbound aircraft on final approach to runway 08. I didn't give avoiding action to the inbound aircraft since I considered it easier to turn the infringer out of the way.☐ Supplementary 12/08/15:☐ As a consequence of this event, separation was lost against a Luton inbound aircraft. DA40 was identified as the aircraft involved following a positive identification using the aircrafts mode S information.☐ Supplementary 17/08/15:☐ I was intending to do some circuits at **** since I had not flown DA40 for 4 weeks. Since the circuit was full, I went on a local flight first. My first mistake was not to study the chart properly and to mark a route on the chart. I did look at the NOTAMs and saw that there was gliding competition at Gransden lodge and therefore wanted to stay as far away from Gransden/as close to the Luton CTR as possible to avoid any gliders. I am of course aware of the Luton CTR and have flown around/transited it before. I chose not to talk to ATC since it was a short/easy flight in CAVOK and saw no need to bother them. I did select the listening squawk after getting airborne. As I crossed the M1 flying westward north of the CTR, I misread the chart - I mistook the fillet of airspace where the CTR goes from SFC to

201511023	11/08/2015	EGTT : London (FIR)	EGGW (LTN): London/Luton		D	CTR	CESSNA	Reciprocating	1	Infringement of the Luton CTR (Class D) by a C182 squawking 0013 indicating 1400ft. Avoiding action given. Standard separation maintained.	I was working as GW INT, with the incident taking place at watch handover time, so the incoming controller was also witness to the following events.☐ I noticed an unknown aircraft in the vicinity of the Pirton VRP, to the north of the GW CTR. It was squawking 0013 and indicating 1400ft, tracking South☐ Eastbound. It continued on this track, subsequently entering and infringing the GW CTR. Mode S data showed the callsign to be a C182 and I immediately made a couple of blind calls to the aircraft, anticipating that he would be listening out due to the use of 0013. The calls went unanswered.☐ I noticed from the departure display that an A319 had been cleared for takeoff on a CPT departure, so telephoned the tower to request that they give it☐ an early avoiding action turn to the right to increase separation against the infringing aircraft. In the meantime the Essex radar controller tried calling the aircraft to see if he was listening out on 120.625 and subsequently managed to gain contact with the infringing aircraft. He advised the pilot of his whereabouts and issued instructions to assist him in leaving CAS by the quickest route. The aircraft was then transferred to the Luton radar frequency.☐ I instructed the pilot to squawk 4670, and formally identified the aircraft as a C182. As he left CAS, I asked if he was happy with his position and his navigation. The pilot's response was along the lines of "Yes I'm fine with that, I was told before departure that if I squawked 0013, stayed below 1500ft and listened out on 120.625 I could just go straight through." I briefly explained that he was obviously getting confused with the rules for the SS TMZs, and that he
201511023	11/08/2015	EGTT : London (FIR)	EGGW (LTN): London/Luton		D	CTR	AIRBUS	Turbofan	2	Infringement of the Luton CTR (Class D) by a C182 squawking 0013 indicating 1400ft. Avoiding action given. Standard separation maintained.	I was working as GW INT, with the incident taking place at watch handover time, so the incoming controller was also witness to the following events.☐ I noticed an unknown aircraft in the vicinity of the Pirton VRP, to the north of the GW CTR. It was squawking 0013 and indicating 1400ft, tracking South☐ Eastbound. It continued on this track, subsequently entering and infringing the GW CTR. Mode S data showed the callsign to be a C182 and I immediately made a couple of blind calls to the aircraft, anticipating that he would be listening out due to the use of 0013. The calls went unanswered.☐ I noticed from the departure display that an A319 had been cleared for takeoff on a CPT departure, so telephoned the tower to request that they give it☐ an early avoiding action turn to the right to increase separation against the infringing aircraft. In the meantime the Essex radar controller tried calling the aircraft to see if he was listening out on 120.625 and subsequently managed to gain contact with the infringing aircraft. He advised the pilot of his whereabouts and issued instructions to assist him in leaving CAS by the quickest route. The aircraft was then transferred to the Luton radar frequency.☐ I instructed the pilot to squawk 4670, and formally identified the aircraft as a C182. As he left CAS, I asked if he was happy with his position and his navigation. The pilot's response was along the lines of "Yes I'm fine with that, I was told before departure that if I squawked 0013, stayed below 1500ft and listened out on 120.625 I could just go straight through." I briefly explained that he was obviously getting confused with the rules for the SS TMZs, and that he

201511063	12/08/2015	EGTT : London (FIR)	EGHF : Lee-On-Solent	3nm West	D	CTR	PIPER	Reciprocating	1	Infringement of the Southampton CTR (Class D) by a PA28.	Once en route towards Hanky, though tacking slightly south of the direct track EGHO-Hanky (as at 1500 and therefore below the northern edge of the Solent CTA), I established contact with Solent Radar I was given a Transponder code and told to remain clear of Soton airspace. I then cleared with Solent, advising I wished to contact Fleetlands, which I did. Fleetlands then put me over to Lee Radio who advised of glider flying at Lee, I was positioning to a left downwind leg for Runway 05 at Lee but widened the circuit to something less than three miles as I wanted good separation from the gliding activity. As mentioned above, and quite exceptional, on the afternoon in question the Sly Demon on my mini iPad had been unable to locate the aircraft position. I was aware that I was close to and below the western edge of the CTA but now appreciate I may have infringed the CTR. My focus was on looking outside for non radio gliders which, in the event, I did not see.
201511068	12/08/2015	EGTT : London (FIR)	Danger Area EG D406	Eskmeals	G	Danger area	PIPER	Reciprocating	1	Infringement of Danger Area EG D406 (Eskmeals) by a PA28. Check fire given.	Eskmeals staff reported to Range Control that an Aircraft was flying over the range from South to North at 15:24 Local time. Check fire given to active firing battery immediately. Range Control contacted Warton ATC to confirm. Warton ATC confirmed aircraft within Air Danger Area and would advise when clear to resume firing. Aircraft confirmed clear by Warton ATC and firing resumed at 15:31 local time. C/S identified aircraft as a PA28.
201511072	12/08/2015	EGTT : London (FIR)	EGSS (STN): London/Stansted		G	Restricted area	MAULE	Reciprocating	1	Infringement of the Stansted TMZ (Class G) by an aircraft squawking 7000 led to a loss of separation. Traffic info given.	At approx. 1538 a primary contact was observed leaving the SX ATZ tracking toward's Ware and promptly activated PCAIT. As it appeared to be an a/c I informed an inbound B737 downwind broke it off to the NE and proceeded to re-position it and the subsequent B737 inbound. SX were contacted shortly after PCAIT activated and the a/c was presumed to be a MX7 that had departed from its destination and transferred to LFLARS. The a/c subsequently started squawking 7000A only (therefore still a TMZ infringer). As the a/c left the TMZ the B737 resumed normal vectors having been extensively delayed. A departure was also delayed for a minute toward's the end of the incident. The a/c later called on Essex, was identified using 7402.
201511072	12/08/2015	EGTT : London (FIR)	EGSS (STN): London/Stansted		G	Restricted area	BOEING	Turbofan	2	Infringement of the Stansted TMZ (Class G) by an aircraft squawking 7000 led to a loss of separation. 201511168	19/07/2015	EGTT : London (FIR)	EGVN (BZZ): Brize norton	Bearing 145 Range 9nm	D	Restricted area	PIPER	Reciprocating	1	Infringement of the Fairford RA(T) by a PA28 squawking 7000. Traffic info given.	I was the FFD Co-ord at the time of the incident when I noticed a 7000 squawk enter the RA(T) at a range of bearing from BZN of 145 at 9nm, I immediately phoned Oxford to ask if they were working any traffic to the South. They were not so I asked them to check their radar as it is Mode-S equipped and I was informed of the registration, however no altitude was notified. Traffic Information was passed to the aircraft in the RA(T) as the controller was not aware of the altitude. The aircraft left the RA(T) at a range and bearing of 035 at 5nm.

201511176	14/08/2015	EGTT : London (FIR)	EGBE (CVT): Coventry		G	ATZ	ROBINSON	Reciprocating	1	Infringement of Coventry ATZ (Class G) by a helicopter squawking 7000 at 1000ft.	Helicopter, not on frequency, transits ATZ N to S at 1A. Aircraft details passed to EGBB, as a/c also crossed BB CAS.
201511181	15/08/2015	EGTT : London (FIR)	EGHI (SOU): Southampton	4.5nm ESE	D	CTR	OTHER	Unknown	1	Infringement of the Southampton CTR (Class D by an unknown aircraft showing as a primary contact at 1000ft. Aircraft identified as a microlight. Standard separation maintained.	At approximately 0759 I observed a primary radar contact entering and just entering the Southampton CTR on a northerly track. I initially considered the primary contact to be spurious but the contact was not tracking into wind and it did not correlate to any known aircraft, so came to the conclusion that the primary contact was an unknown aircraft.□ ***7LM was on final approach having commenced an NDB approach for runway 02 and had been transferred to Southampton Tower on 118.200MHz when the primary radar contact was observed. The aircraft had been transferred slightly later than normal due to an Non-Standard Flight operating inside the CTR at the docks. I made blind transmissions whilst the on-coming controller contacted Lower Upham airfield to ascertain whether the aircraft was inbound to their field. I contacted the aerodrome controller to advise them of the unknown contact and whether they were able to see anything. We both considered the safest option was to allow the ***7LM to land rather than 'go-around'. ***7LM was not passed traffic information relating to the unknown aircraft given the relative positions of the two aircraft with ***7LM in the late stage of the final approach. I made further 'blind transmissions' but received no response. It is not possible to provide a vertical separation between the microlight and ***7LM but the lateral distance is believed to be 3.5NM. The aerodrome controller subsequently reported that the unknown aircraft could be seen. Lower Upham later reported a microlight had over flown their sight at approximately 1000FT. Roughay Farm also telephoned the unit to state a orange coloured microlight had over flown their site at 300FT. ***8WQ, a Southampton departure from runway 02, was delayed until the unknown
201511181	15/08/2015	EGTT : London (FIR)	EGHI (SOU): Southampton	4.5nm ESE	D	CTR	DE HAVILLAND	Turboprop	2	Infringement of the Southampton CTR (Class D by an unknown aircraft showing as a primary contact at 1000ft. 201511192	15/08/2015	EGTT : London (FIR)	EGGW (LTN): London/Luton		D	CTR	DE HAVILLAND	Reciprocating	1	Infringement of the Luton CTR (Class D) by an aircraft squawking 0013 indicating 2400ft. Traffic info given. Check all imposed. Inbound aircraft sent around.	At about 14.48z I noticed a A0013 squawk had entered the Luton CTR from the west indicating 2400 feet. I called the TWR and put a check all on. TWR called back to say they couldn't get the departure off the runway so C560 was going around. I told TWR to turn him south immediately rather than follow the standard missed approach to keep him away from the infringer. I also had to delay two subsequent inbounds to allow the C560 to be re-positioned. When able I made a blind transmission to the infringer to see if he was on the frequency. He identified himself and stated that he was lost. I got him to put a squawk of 4674 and helped him with his navigation to his destination.
201511192	15/08/2015	EGTT : London (FIR)	EGGW (LTN): London/Luton		D	CTR	CESSNA	Turbofan	2	Infringement of the Luton CTR (Class D) by an aircraft squawking 0013 indicating 2400ft. Traffic info given. 201511228	16/08/2015	EGTT : London (FIR)	EGGW (LTN): London/Luton	Bearing 270 Range 5nm	D	CTR	DE HAVILLAND	Reciprocating	1	Infringement of the Luton CTR (Class D) by a primary contact. Traffic and avoiding action given. Separation lost.	At approximately 1700z I was in control of the Luton Radar position when a primary radar contact entered the CTR, south bound, cutting through the 08 extended centre-line approximately 5 miles west of the airport. At the time I had an A320 establishing on the ILS for runway 08, therefore I broke it off the approach and gave traffic information. I believe separation was lost between A320 and the unknown aircraft. I attempted blind calls in case the unknown aircraft was on frequency, however there was no reply. When I phoned tower to inform them about the situation, they informed me that a B737 was rolling on a CPT departure. I instructed them to keep the aircraft on runway heading, so to not turn right as per the normal SID track and into confliction with the unknown aircraft. B737 was subsequently turned away and climb was co-ordinated with London Control. After leaving the zone, the unknown aircraft appeared to land at RAF Henlow at around 1730z. I attempted to phone various Henlow phone numbers, however there was no answer. It is worth noting that once the aircraft had left controlled airspace to the south of airport it was clear the pilot then knew where they were because they perfectly circumnavigated the CTR round to the east, before landing at their destination. Subsequently, at around 1750z, we received a phone call from the Tower saying that they had received a phone call from the pilot who admitted that they thought they had infringed controlled airspace. The pilot left their contact details.

B737 was subsequently turned away and climb was co-ordinated with London Control. After leaving the zone, the unknown aircraft appeared to land at RAF Henlow at around 1730z. I attempted to phone various Henlow phone numbers, however there was no answer. It is worth noting that once the aircraft had left controlled airspace to the south of airport it was clear the pilot then knew where they were because they perfectly circumnavigated the CTR round to the east, before landing at their destination. Subsequently, at around 1750z, we received a phone call from the Tower saying that they had received a phone call from the pilot who admitted that they thought they had infringed controlled airspace. The pilot left their contact details.
201511235	16/08/2015	EGTT : London (FIR)	Isle of Wight		D	CTR	PIPER	Reciprocating	1	Infringement of the Southampton CTR (Class D) by a PA32 at 3000ft.	Flew at 3000' over the IOW and accidentally cut the south east corner of the Solent zone where the ceiling was 2000'. Decision to go to 3000' vs initial altitude of 2000' was to increase safety. This was purely accidental, and I have learnt to be more careful the next time I fly over the IoW.
201511239	17/08/2015	EGTT : London (FIR)	SAM	14.8nm SSW	D	CTA	AVIONS ROBIN	Reciprocating	1	Infringement of the Solent CTA 2 (Class D) by an unknown aircraft squawking 7000, indicating 2400ft. Aircraft identified as a DR400. AIW activated. Traffic info given. Standard separation maintained.	Airspace Infringement - Solent CTA 2. A primary and secondary radar contact was observed entering the Solent CTA-2, displaying transponder code 7000 and indicating an altitude of 2400FT. (Solent CTA-2 base: 2000FT) on an east north easterly track between the Needles and Cowes. The AIW activated. Blind transmissions were made in respect of the unknown aircraft with respect to its track and altitude. The Mode S data block provided a callsign of DR400, but the first blind transmission referred to another a/c reg, but this was subsequently corrected for further transmissions. I contacted Bournemouth Radar and queried whether they were in contact with the aircraft. The response was "yes, he called but I don't know where he is....can't see him". I explained to the Bournemouth controller the situation and they offered, and I agreed, for the aircraft to descend below 2000FT. The aircraft subsequently descended below the base of the Solent CTA. An inbound DHC8 aircraft had been given descent to 5000FT on a heading to position downwind right hand runway 02 for the NDB approach. As the aircraft passed abeam SAM, DHC8 was instructed to stop descent at 6000FT, which was read back correctly, and turned on to a heading of 290 degrees. The descent to 6000FT kept the aircraft within Class A airspace and the flight crew advised that the heading was to keep clear of the unknown aircraft. Once the unknown aircraft had left the CTA, DHC8 was re positioned for the approach. Approximate delay for arrival: 5 minutes.

201511239	17/08/2015	EGTT : London (FIR)	SAM	14.8nm SSW	D	CTA	DE HAVILLAND	Turboprop	2	Infringement of the Solent CTA 2 (Class D) by an unknown aircraft squawking 7000, indicating 2400ft. An inbound DHC8 aircraft had been given descent to 5000FT on a heading to position downwind right hand runway 02 for the NDB approach. As the aircraft passed abeam SAM, DHC8 was instructed to stop descent at 6000FT, which was read back correctly, and turned on to a heading of 290 degrees. The descent to 6000FT kept the aircraft within Class A airspace and the flight crew advised that the heading was to keep clear of the unknown aircraft. Once the unknown aircraft had left the CTA, DHC8 was re positioned for the approach. Approximate delay for arrival: 5 minutes.
201511241	15/08/2015	EGTT : London (FIR)	SAM	13nm NNE	D	CTA	PIPER	Reciprocating	1	Infringement of the Solent CTA 5 (Class D) by an unknown aircraft squawking 3660, indicating 3000ft. Aircraft identified as a PA28. Standard separation maintained.	Infringement of Solent CTA 5. A contact was observed with a Farnborough squawk around 13nm NE of Southampton tracking SE. It was indicating 3A. Farnborough were phoned by the coordinator and said the a/c was coming to us. The a/c finally called us but this was after it had infringed CAS. It was identified and given a BS.
201511251	15/08/2015	EGTT : London (FIR)	Not specified		A	Airway - ATS Route	BEECH	Reciprocating	1	Infringement of Airway Q41 by an aircraft squawking 1177 indicating 5600ft.	Aircraft was alleged to have infringed EGJJ CTR. The flight was routing between a position east of Weymouth and ORTAC, and onwards to Cherbourg beacon. The flight was last reported at altitude 2,800ft on the Portland RPS (QNH1008) with an ORTAC ETA/1050. The flight reported transferring to EGJJ (125.2) at 1059. Due to severe RTF loading the FIS-W frequency was operating independently due to the large amount of traffic in the region. I did not have the opportunity to pass an estimate to EGJJ beforehand as due to rostered staffing I am obliged to work single-handed and without the assistance of a FIS ATSA or third FISO, which increases FISO workload and which may have contributed to the incident.☐ Supplementary 17/08/15:☐ Having reviewed the LTCC Multi Track Radar. The pilot was observed to infringe Q41 (Base of 3500 feet) at 10:55:08 indicating 5600 feet. The aircraft continued on a south-easterly track towards ORTAC fluctuating between 5600 and 5800 feet exiting the UK FIR at 10:57:44 entering the Jersey CTA.☐ Supplementary 19/08/15:☐ I saw BE36 approaching Q41 from the north west squawking 1177 with no details in the Jersey flight data system. The aircraft then infringed Q41, where there was traffic at FL060 but well clear. As it approached the airspace boundary, Zone 2 spoke to London Sector 20 and London Information about the traffic. It eventually called 125.2 approx 3 miles inside the CICTR at flight level 55, was identified and informed that it had infringed channel islands airspace. After handover, the next controller ascertained the aircraft type, point of departure
201511325	18/08/2015	EGTT : London (FIR)	EGCC (MAN): Manchester/Intl	10nm NW	D	CTR	PIPER	Reciprocating	1	Infringement of the Manchester CTR (Class D) by a PA28 squawking 7000, indicating 2000ft. AIW activated. Standard separation maintained.	A 7000 squawk approaching Leigh Flash inbound from the North West triggered the AIW due to its altitude of 2000ft indicated on Mode C fltnum 1JM was given a wider heading from MIRSI to ensure separation at FL60. Free calls were made and FIN DIR called Manchester Barton who had the aircraft on frequency and advised him to descend. No outbounds were pending at this time and Air 2 were made aware of the AIW.☐ Supplementary 27/08/15:☐ The DI became permanently caged during the flight (reported on landing) Using the less damped compass did, I believe, cause me to spend too much time observing this instrument as I made the turn from the M6/M58 junction VRP. Consequently, I missed some ground references including the Haydock Park VRP, Leigh, and the Leigh Flash reservoir before I was too far South. I do know these and other surrounding land marks well and regularly use them for Navigation purposes from the VRP and to ensure I keep clear of the LLCD before heading South for Barton. I have made changes to my procedures when flying into Barton whilst using the M6/M58 junction VRP. It has been my past practice to take up a heading of 105 deg from the VRP to avoid the North East corner of the LLCD before turning for Barton. I will now fly 090 deg from the VRP for 11 miles before turning South for the Barton overhead at 1800ft; this will ensure I remain well clear of the LLCD whilst observing the upper limits of adjacent airspace. More generally, I will be sure to always squawk conspicuity codes and monitor the relevant frequencies whenever they are available. In the case of Manchester (7366 & 118.575) I will use this facility until no more than 5 miles from Barton.
201511325	18/08/2015	EGTT : London (FIR)	EGCC (MAN): Manchester/Intl	10nm NW	D	CTR	UNKNOWN	Unknown		Infringement of the Manchester CTR (Class D) by a PA28 squawking 7000, indicating 2000ft. AIW activated. Standard separation maintained. 201511448	20/08/2015	EGTT : London (FIR)	WAL	7nm W	D	CTA	AVIONS ROBIN	Reciprocating	1	Infringement of the Liverpool CTA (Class D) by a DR400 at 2800ft. Standard separation maintained.	Infringement of regulated airspace to the west of WAL by DR400. Whilst operating as Liverpool radar control and providing a basic service to DR400 I noticed a Squawk #5050 inside class D airspace to the west of the WAL VOR. Believing this could be DR400 I asked the pilot to squawk ident, which he did. This confirmed the identity of the infringing aircraft as being DR400. I then instructed DR400 to descend to not above altitude 2000 feet to leave controlled airspace. DR400's destination was then contacted to request they ask the pilot of DR400 to contact Liverpool ATC once he had landed. The pilot, did contact Liverpool ATC. He acknowledged his error was very apologetic.
201511522	21/08/2015	EGTT : London (FIR)	EGKK (LGW): London/Gatwick	Bearing 080 Range 13nm	D	CTA	CESSNA	Reciprocating	1	Infringement of the Gatwick CTA (Class D) by a C152 squawking 1731 at 2000ft. Traffic info given. Separation lost.	I was operating on LARS East with 3 a/c on frequency. As a fourth a/c called I observed a C152 tracking towards KK. At this point the controller on my right also alerted me to the a/c and the KK DCT line illuminated. I instructed the aircraft to descend to 1500 feet the pilot did not respond. The a/c was observed turning right so I instructed aircraft to turn right to head East. The pilot responded and started to descend and turned East. The pilot sounded confused and made me aware that he was unsure of his position. I provided him with a track to MD and track distance. I then provided assistance to enable the pilot to find Bewl Water. Once the pilot had located Bewl Water he reported happy to continue his own navigation.☐ Supplementary 22/08/15:☐ A319 was on a closing heading for the ILS runway 26L. I noticed an aircraft to the South of them wearing a Farnborough LARS East squawk of☐ 1731, at altitude 2100ft and heading directly West towards the edge of the CTA where the base of CAS changes from 2500ft to 1500ft. It became immediately apparent that this aircraft was going to infringe CAS, and I phoned Farnborough to ensure they were aware of the situation and were going to take appropriate action, which I was assured they were on both counts. The aircraft was certainly in proximity to the A319 as it entered the CTA, but taking into account the tracks, relative speeds, the stage of the approach for the A319 and the information I had obtained from Farnborough that they were actively seeking to resolve the situation, I deemed that the proximity was not unsafe enough to warrant avoiding action. Traffic information was passed, but the safest and most practical course of action using my

201511535	22/08/2015	EGTT : London (FIR)	EGMC (SEN): Southend	CTA 7	D	CTA	CIRRUS	Reciprocating	1	Infringement of the Southend CTA 7 (Class D) by a SR22 at 3500ft. Traffic info given. Standard separation maintained.	Southend controlled airspace infringement. SR22 observed on Mode S tracking towards the CTA7 boundary at altitude 3500ft mode C squawking 1177. London FIR South contacted by Southend Radar and asked for SR22 to be transferred to 135.450 Southend DIR and descend to altitude 3000 QNH. (B717 inbound via DET not yet coordinated with Thames radar). SR22 contacted Southend DIR and was given appropriate clearance and advised of infringement.
201511538	22/08/2015	EGTT : London (FIR)	OKESI	S	A	CTA	CESSNA	Turboprop	1	Infringement of the Cotswold CTA (Class A) by a C208 at FL115. Standard separation maintained.	At time 10.40z 0033 SSR code was observed within the confines of S23 just north of danger area D128 at FL05-115, the base of the Cotswold CTA here is FL105. From the mode S address this was confirmed as callsign C208, operated by military ATC. At time 10.54z another 0033 SSR code but not the same a/c as this had descended, was observed to possibly penetrate at a similar place and level. There was no mode S address for this return but likely to be operating from military base due to its similar location. This is far from the first occasion that these a/c have penetrated CAS. If this continues to happen, in my opinion it will only be a matter of time before it either leads directly to an incident or is a contributory factor in an event on S23 which given its complexity and congestion is already a trouble spot for overloads. I believe the LAS on Duty spoke by telephone to military base but I have no further details on the outcome of this call.
201511547	19/08/2015	EGTT : London (FIR)	EGKK (LGW): London/Gatwick	S	A	TMA	FOURNIER	Reciprocating	1	Infringement of the LTMA by an unknown aircraft squawking 7000 at 3400ft. Aircraft identified as a Fournier RF5. Departures were stopped as a precaution. Standard separation maintained.	Infringement of CAS south of Gatwick. An a/c squawking 7000 was observed to enter CAS WSW of Gatwick and track in an easterly direction for approx 20nm at 3.4A. BOGNA departures were stopped as a precaution. Farnborough LARS and Shoreham were called to see if they were working the a/c but they advised that they weren't. The a/c left CAS approx. 15nm south of Gatwick. It was identified on mode S as a Fournier RF5 and appeared to land on the south coast.☐ Supplementary 01/09/15:☐ Late identification of geographical fix which made us aware that we were about to (or had entered Gatwick CTA), and which caused us to make a rapid descent to 2000 feet. Suggested Actions to Prevent a Recurrence: That one pilot should monitor progress of the map reading pilot with GPS to ensure compliance with controlled airspace, and maintain radio contact with Radar unit.
201511549	22/08/2015	EGTT : London (FIR)	EGSS (STN): London/Stansted	Bearing 360 Range 12nm		CTA	CESSNA	Reciprocating	1	Infringement of the Stansted CTA (Class D) by a C172 squawking 7000 at 2000ft. Traffic info given. Standard separation maintained.	An a/c squawking 7000 at 2A was observed to enter the northern SS CTA. The sector was being split at the time. A320 was on a closing heading for 22 on the other side of the loc and given traffic. The unknown a/c started tracking NE and was contacted after I made a blind transmission to the aircraft which was believed to be the a/c identified on Mode S. Aircraft replied and was identified and Mode C verified as 2A. I instructed the pilot to leave the zone immediately to the NE.
201511549	22/08/2015	EGTT : London (FIR)	EGSS (STN): London/Stansted	Bearing 360 Range 12nm		CTA	AIRBUS	Turbofan	2	Infringement of the Stansted CTA (Class D) by a C172 squawking 7000 at 2000ft. Traffic info given. Standard separation maintained.	An a/c squawking 7000 at 2A was observed to enter the northern SS CTA. The sector was being split at the time. A320 was on a closing heading for 22 on the other side of the loc and given traffic. The unknown a/c started tracking NE and was contacted after I made a blind transmission to the aircraft which was believed to be the a/c identified on Mode S. Aircraft replied and was identified and Mode C verified as 2A. I instructed the pilot to leave the zone immediately to the NE.

201511566	24/08/2015	EGTT : London (FIR)	DET	25nm SE	A	TMA	SOCATA	Reciprocating	1	Infringement of the LTMA (Class A) by an unknown aircraft initially squawking 7000. Aircraft identified as a Socata TB20. Standard separation maintained.	I was working on BIG/TIM bandboxed and an inbound Socata TB20 had been co-ordinated into my sector off-route from the NE avoiding weather at FL80. TCE later advised us that the traffic had requested descent and would work the FIR, the a/c squawked 7000 and I highlighted it in case it would be co-ordinated with Thames. When the traffic was SW of TANET I observed the squawk change to 1730, the a/c altitude was 4.2A and the track of the a/c looked like it would re-enter CAS. At this them I co-ordinated a KB arrival at 5A with Thames and pointed out the traffic on the assumption that it would either be co-ordinated with Thames or turn/descend to avoid CAS. I was handing over the sector at the time and pointed out the traffic to the incoming controller as the KB inbound was at 6A on a crossing track. At this time it was still OCAS. I then looked up the squawk and saw it was a Farnborough LARS E squawk. The a/c then infringed CAS to the SE of DET. The incoming controller rang Thames to see if LF LARS had co-ordinated the traffic and they had not. Thames agreed to take the KB arrival at 6A as it looked like 5 miles separation would be achieved. The 1730 squawk then turned to leave CAS and descended.
201511574	22/08/2015	EGTT : London (FIR)	EGGW (LTN): London/Luton		D	CTA	DIAMOND	Reciprocating	1	Infringement of the Luton CTA (Class D) by an unknown aircraft squawking 7000 climbing to 2700ft. Aircraft identified as a Diamond HK36. CAIT activated. Check all imposed.	I was working as GW INT & GW FIN bandboxed. At approximately 1130, I noticed a 7000 squawk near BPK that has activated CAIT as the altitude was indicating 2600ft where the base of CAS is 2400ft. The aircraft was then seen to climb to 2700ft indicated and I called GW tower to Check East as eastbound departures route towards that area. At minute or two earlier, an easterly departure from GW had got airborne (callsign unknown) but was under the control of TMA North (118.825). I do not think that 5nm or 5000ft was achieved. The 7000 squawk was then observed to route towards Panshanger disused and then J6 of the A1(M) - Welwyn Garden City before turning southbound and then northbound again while climbing to 3500ft. I changed the Check East to Check All to stop all departures and held the three inbound aircraft on my frequency in the final approach area. No more GW inboundes were accepted from Essex with the Gate standing agreement suspended. These aircraft were held by Essex. The tower reported that they could see the aircraft but could only tell me that it was a fixed wing. The aircraft came within 4nm of GW airport (routed via the LUT) and then left controlled airspace to the north, climbing to 3700ft, and then briefly entered the controlled airspace located further north of Luton. Once the aircraft was clear of controlled airspace and seemed to be continuing away from Luton, I removed the check all and began vectoring aircraft to land. No movements occurred for approximately 15 minutes due to the infringing aircraft, which seemed to continue towards the Northampton area and beyond. I made several blind calls on the RT with no success.☐ Supplementary 26/08/15:☐
201511574	22/08/2015	EGTT : London (FIR)	EGGW (LTN): London/Luton		D	CTA	BOMBARDIER	Turbofan	2	Infringement of the Luton CTA (Class D) by an unknown aircraft squawking 7000 climbing to 2700ft. 201511616	22/08/2015	EGTT : London (FIR)	Taff ELY VRP	2nm S			PIPER	Reciprocating	1	Infringement of the Cardiff CTA (Class D) by a PA32 at 3000ft. Standard separation maintained.	I was the radar ATCO. Radar was boxed. Workload was light, but with IFR weather avoiding. The ATSA was present. I noted PA32 approx. 1nm north of Cardiff CTA 3 at altitude 3000ft and heading towards controlled airspace. I asked the aircraft if it required entry clearance and got no response. The aircraft continued towards CAS without establishing communication. I passed a blind clearance to enter CAS, to which an incomplete readback was received. By this time the aircraft had entered CAS. After prompting, a correct readback of the clearance was received.
201511619	21/08/2015	EGTT : London (FIR)	SAM	7nm E	D	CTA	EUROPA	Reciprocating	1	Infringement of the Solent CTA 7 (Class D) by an unknown aircraft squawking 7000, climbing through 3000ft to 3800ft. Aircraft identified as a Europa. Standard separation maintained.	At 1826 a contact was observed climbing into the Solent CTA-7 without a clearance. Blind calls were made for the aircraft using the observed Mode S downlink callsign Europa. The position of the aircraft as it entered controlled airspace was SAM 080R 7nm, routing north, climbing through 3A to 3.8A before leaving the lateral limits of the CTA.
201511683	19/08/2015	EGTT : London (FIR)	EGTO (RCS): Rochester		A	TMA	PIPER	Reciprocating	1	Infringement of the London TMA (Class A) by a PA28 squawking 1177 at 3600ft.	At 1449, aircraft called me East of Rochester at 3,000', I told him to squawk 1177 and gave him a basic service and gave him the Chatham regional QNH as he was heading towards DVR. My colleague took a phone call from Farnborough LARS informing us that the A/C's mode c was indicating 3,700'. I asked the aircraft to confirm his altitude, which he reported at 3,600' and I then asked him to confirm that he was remaining outside all controlled airspace, after which he apologised and descended to 2,500' very shortly after. At no time did the pilot indicate that he had left 3,000' and he did not report climbing and passing on first contact. In retrospect I could have given the pilot the London QNH but as the difference was only 5 hectopascals (150ft) it would not have prevented the pilot from infringing controlled airspace on this occasion
201511827	20/08/2015	EGTT : London (FIR)	EGVO (ODH): Odiham		G	ATZ	PIPER	Reciprocating	1	Infringement of the Odiham ATZ (Class G) by a PA28 squawking 4752.	At 1329z a radar track squawking 4572 NMC was observed to enter the lateral dimensions of the Odiham ATZ by approx 0.5nm routing East-West. As the aircraft passed close to Odiham it was visually confirmed to be a white PA28 flying below the main cloud base (reported at OVC 1800ft AGL). An Odiham based aircraft was in the process of departing VFR to the South sighted the aircraft and declared there to be no immediate confliction at approx 1-2nm separation. The radar contact was followed to the vicinity of Popham, where it faded from radar. A subsequent telephone call to Popham confirmed that an aircraft matching the infringer's description had landed at a corresponding time, the registration obtained and the pilot requested to call Odiham. The pilot subsequently apologised for entering the ATZ and stated that he was flying further north than usual to avoid weather. He believed that the was further south than his actual track and under the impression that, by squawking 4572, Farnborough would have warned him of his proximity to any airspace restrictions.
201511869	27/08/2015	EGTT : London (FIR)	EGCN : DONCASTER SHEFFIELD	10nm South	D	CTA	PIPER	Reciprocating	1	Infringement of the Doncaster Sheffield CTA (Class D) by a PA28 squawking 6170 at 3500ft.	#6170 enters CAS west of GAM at A3.5. Aircraft was called and identified.

201511885	28/08/2015	EGTT : London (FIR)	POL	5nm South	A	CTA	PIPER	Reciprocating	1	Infringement of the Manchester CTA (Class D) by a PA28 squawking 7000 with Mode C indicating 3700ft. CAIT activated. Standard separation maintained.	I observed a 7000 squawk trigger an AIW alert south of POL VOR - Mode C indicating 3700A unverified. Using the RDP target information window, the Mode S of the a/c showed the registration. I made several broadcasts on the frequency (as did DIR) to ascertain if the pilot was listening out but received no reply. The contact continued to track SSE and transited the CTA and CTR indicating altitudes between 3500 and 3800 ft, continuously triggering the AIW alert. Manchester inboundS were vectored to remain at least 5 miles from the contact. I warned East Midlands by phone that the a/c was tracking towards their zone, although just north of Camphill it turned onto a more SE track. No further□ action was possible and no report subsequently from East Midlands that they had made contact with the a/c.□ Supplementary 29/08/15:□ CAIT activated on a A7000 squawk south of POL. Aircraft mode C indicating between A3400 and A3800, base of the MTA in this location A3500. The CAIT deactivated when aircraft dropped out of the MTA for a short while then reactivated as it entered the EGCC CTA at A3400(base A3000) the aircraft then climbed to A3800 indicated back into the MTA(base A3500). From mode s tab on radar aircraft showed call sign. I warned EGCC approach who had seen it and called blind. I checked with both EGNM and EGCN but neither had worked the traffic. The LAS was informed and I asked for him to contact EGNX as the aircraft was tracking in their direction. There was no impact on any traffic in the sector. The next controller continued to track the aircraft which was seen to orbit and descend to 500ft in the
201511885	28/08/2015	EGTT : London (FIR)	POL	5nm South	A	TMA	PIPER	Reciprocating	1	Infringement of the Manchester CTA (Class D) by a PA28 squawking 7000 with Mode C indicating 3700ft. CAIT activated. Standard separation maintained.	I observed a 7000 squawk trigger an AIW alert south of POL VOR - Mode C indicating 3700A unverified. Aircraft believed to be a PA28. Traffic info given.	I was working TC South East Band boxed A380 was leaving EPM heading 125 degrees an infringer popped up in the A380's 12 o clock at 1900 ft. I initially turned the A380 right 105 degrees and when I realised that wasn't enough I continued the turn heading 090 degrees. I did not prefix the turn with avoiding action. □ Supplementary 03/09/15: □ Strong head wind, climb rate unexpected at such a rate.
201511906	30/08/2015	EGTT : London (FIR)	EGHI (SOU): Southampton	7.5nm N	D	CTA	UNKNOWN	Unknown		Infringement of the Solent CTA 1 (Class D) by an unknown aircraft showing as a primary contact only squawking 7000, indicating 1600ft climbing to 1700ft. AIW activated. Traffic info and avoiding action given to a PA28. Standard separation maintained.	PA28 was at 5000FT IFR and in receipt of a Radar Control Service crossing the Solent CTA, on its own navigation between SAM and CPT. Two primary only radar contacts were observed approaching the Solent CTA-5 boundary on a south westerly track and then continued towards the Solent CTA-3 boundary. The tracks indicated they would pass towards CTA-1. PA28 was advised of the primary contacts and advised that it was assumed the aircraft were operating beneath controlled airspace at the time (below 2000FT). PA28 was advised that it may become necessary to turn to avoid the aircraft, if necessary, but would be kept advised. A 7000 transponder code appeared indicating an altitude of 1600FT followed by a climb to 1700FT. PA28 was instructed to turn right onto a heading of 060 degrees as avoiding action. I was aware that at the time I had in excess of 3000FT separation but as the unknown contact was commencing a climb it was possible that this separation may have been eroded. The AIW activated and at the same time, blind transmissions were made in relation to Southampton, Winchester and Romsey. The mode S data block did not provide any callsign or additional information. The ATSA informed Bournemouth Radar of the situation and also tracked the aircraft for as long as possible. Bournemouth ATC did not provide the aircraft with a service. The primary and secondary contact faded below cover approximately 25NM west of Southampton, 10 minutes later. Vertical Separation: 3300FT. Estimated Lateral Separation: 2.8NM
201511906	30/08/2015	EGTT : London (FIR)	EGHI (SOU): Southampton	7.5nm N	D	CTA	PIPER	Reciprocating	1	Infringement of the Solent CTA 1 (Class D) by an unknown aircraft showing as a primary contact only squawking 7000, indicating 1600ft climbing to 1700ft. 201511908	30/08/2015	EGTT : London (FIR)	EGLL (LHR): London/Heathrow		D	CTR	SOCATA	Reciprocating	1	Infringement of the Heathrow CTR (Class D) by a TB20 at 1000ft. Departures to the South were suspended and fltnum 460 had their take-off clearance cancelled. Traffic info given. Standard separation maintained.	TB20 Infringement No Loss. TB20 entered the Heathrow CTR to the south of Heathrow, tracking northbound. Heathrow departures to the south were immediately suspended. The aircraft took an immediate left turn and left controlled airspace quickly after before landing at ****. **** report the aircraft as a TB20. Fltnum 460 had been cleared for take-off from 09R at Heathrow but had not yet started rolling. His take-off clearance was cancelled.
201511908	30/08/2015	EGTT : London (FIR)	EGLL (LHR): London/Heathrow		D	CTR	UNKNOWN	Unknown		Infringement of the Heathrow CTR (Class D) by a TB20 at 1000ft. Departures to the South were suspended and fltnum 460 had their take-off clearance cancelled. Traffic info given. Standard separation maintained.	TB20 Infringement No Loss. TB20 entered the Heathrow CTR to the south of Heathrow, tracking northbound. Heathrow departures to the south were immediately suspended. The aircraft took an immediate left turn and left controlled airspace quickly after before landing at ****. **** report the aircraft as a TB20. Fltnum 460 had been cleared for take-off from 09R at Heathrow but had not yet started rolling. His take-off clearance was cancelled.

201511909	30/08/2015	EGTT : London (FIR)	MONTY		A	Airway - ATS Route	CESSNA	Reciprocating	1	Infringement of Airway N864 (Class A) by a C208 at 4700ft at MONTY. CAIT activated. Standard separation maintained.	Infringer at Monty. C208,working FIR on squawk 1177 climbed to altitude 4700' and infringed 3nm SW MONTY. CAIT activated, no other traffic in vicinity.
201511910	28/08/2015	EGTT : London (FIR)	EGKK (LGW): London/Gatwick	12mn E	D	CTA	CESSNA	Reciprocating	1	Infringement of the Gatwick CTA (Class D) by a C172 between 2500ft and 2700ft, squawking 7010. ATC were unable to establish contact with the C172. Traffic info given. Standard separation maintained.	Zone infringer. C172 flew Southbound approx 12 miles east of Gatwick indicating an altitude of between 2500 feet and 2700 feet. The aircraft was squawking 7010 but despite the efforts of Gatwick Fin, Gatwick Int, Gatwick tower and Farnborough Radar the aircraft could not be contacted. Several aircraft were held in the stack some were given additional vectoring to ensure separation was not lost. When it was 4 miles north of Mayfield it changed its squawk to 7000, indicated an altitude of 2400 feet and subsequently landed at ****.
201511911	28/08/2015	EGTT : London (FIR)	MALBY	6nm ENE	A	Airway - ATS Route	SCOTTISH AVIATION	Reciprocating	1	Infringement of Airway L9 (Class A) by a Bulldog at FL75 squawking 5061. Standard separation maintained.	Whilst receiving a Traffic Service in the Kemble area a Bulldog was seen to enter the airway L9 during a general handling manoeuvre 6NM ENE of MALBY at FL75 where the base is FL65. The aircraft was informed that he had entered the airway and instructed to descend immediately to vacate. London S23 controller was informed by telephone. The aircraft then asked if paperwork would be filed, to which I advised, yes. He advised that he would also file a report and acknowledged that he had been confused over location and base levels, thinking that the base was FL75 in his location.
201511912	30/08/2015	EGTT : London (FIR)	Manchester	LLR	D	CTR	PIPER	Reciprocating	1	Infringement of the Manchester CTR (Class D) by an unknown aircraft squawking 7000 at 1400ft, climbing to 1600ft. Aircraft identified as a PA28. CAIT activated. Standard separation maintained.	PA28 Manchester LLR CAIT Infringement. CAIT activated in the Manchester LLR at 1204Z, the callsign was PA28 at A14 on a 7000 squawk tracking southbound near ASMIM. It subsequently climbed to A16 at 1206Z, still on a 7000 squawk. We asked Manchester Approach if he was listening on their frequency as it was likely Wallasey would have had to take avoiding action against the unknown traffic with the 3 Manchester departures pending. Before Manchester confirmed he was not on their frequency we realised we needed to TOSR departures into Wallasey sector, which we did for about a minute until Manchester felt they could provide Wallasey sector with the requisite separation against the unknown traffic. At time 1207Z it changed to a Liverpool squawk of 5050 and descended to A13 (QNH 1019). We called Liverpool at 1211Z to ascertain what QNH the pilot had selected prior to calling them and they said it was 1019 (the Manchester QNH). Wallasey Support phoned Liverpool Support to find out further details about the flight.
201511950	01/09/2015	EGTT : London (FIR)	EGHI (SOU): Southampton	Solent CTA-7	D	CTA	CIRRUS	Reciprocating	1	Infringement of the Solent CTA 7 by an unknown aircraft squawking 7000 indicating 4500ft. Aircraft identified as an SR22. Standard separation maintained	SR22 had called me but was instructed to standby due my workload, when I looked on radar I could see a 7000 entering CAS, it was identified using mode S. No loss of separation.

201511951	01/09/2015	EGTT : London (FIR)	EGNX (EMA): NOTTINGHAM EAST MIDLANDS	12nm E	D	CTA	VANS	Reciprocating	1	Infringement of the East Midlands CTA 2 by an unknown aircraft squawking 7000 indicating 2000ft, resulting in a loss of separation with an incoming B737. Traffic info and avoiding action given. Unknown aircraft identified as a Vans RV8.	B737 was being vectored for an ILS approach to runway 27. Whilst on a base leg, heading 360 and descending, an unknown contact was observed squawking 7000 indicating 2000ft approaching the eastern controlled area (CTA2). The B737 was advised of a potential imminent zone infringer and was initially turned 15 degrees left. The unknown aircraft was then seen entering controlled airspace at which point B737 was turned onto 270 degrees to keep clear. The unknown aircraft continued on a south, south westerly track, maintaining 2000ft, though the control area. B737 was routed north west through the final approach before subsequently being turned right hand downwind. Unfortunately mode S was unavailable at East Midlands at the time of the incident. However, a conversation with the Birmingham radar assistant revealed that the mode S of the unknown aircraft was showing a Vans RV8. At time 1558Z this was confirmed a second time, this time with the Birmingham Radar Director. An exact range and bearing based on Coventry was used to transfer the identity.□ Appropriate CAA action being taken.
201511951	01/09/2015	EGTT : London (FIR)	EGNX (EMA): NOTTINGHAM EAST MIDLANDS	12nm E	D	CTA	BOEING	Turbofan	2	Infringement of the East Midlands CTA 2 by an unknown aircraft squawking 7000 indicating 2000ft, resulting in a loss of separation with an incoming B737. Traffic info and avoiding action given. Unknown aircraft identified as a Vans RV8.	B737 was being vectored for an ILS approach to runway 27. Whilst on a base leg, heading 360 and descending, an unknown contact was observed squawking 7000 indicating 2000ft approaching the eastern controlled area (CTA2). The B737 was advised of a potential imminent zone infringer and was initially turned 15 degrees left. The unknown aircraft was then seen entering controlled airspace at which point B737 was turned onto 270 degrees to keep clear. The unknown aircraft continued on a south, south westerly track, maintaining 2000ft, though the control area. B737 was routed north west through the final approach before subsequently being turned right hand downwind. Unfortunately mode S was unavailable at East Midlands at the time of the incident. 201511953	30/08/2015	EGTT : London (FIR)	Not specified		D	CTR	CESSNA	Reciprocating	1	Infringement of the Heathrow CTR (Class D) by an unknown aircraft squawking 7000. Aircraft identified as a C152. The aircraft infringed a further two times whilst trying to identify an inbound VRP. Standard separation maintained.	Heathrow CTR infringer C150. I was working as OJTI on Thames. At approx 1044Z, a 7000 squawk entered the Heathrow CTR west of Denham. Heathrow were informed, and they turned downwind traffic away. Denham were called, and eventually the aircraft called them as it was inbound. The aircraft infringed a further 2 times whilst trying to identify the inbound VRP.
201512161	02/09/2015	EGTT : London (FIR)	EGSS (STN): London/Stansted		D	CTA	PIPER	Reciprocating	1	Infringement of the Stansted CTA (Class D) by a PA28 at 2000ft. Three inbound aircraft were given extended routings. Standard separation maintained.	At 15:09 I noticed a primary return approaching the Stansted CTA/TMZ 1, SW of Haverhill VRP. I also highlighted it to the Essex radar Controller. It was then see to enter the CTA on a southerly track and then changed to a Wattisham radar squawk. I telephoned them for identification. They confirmed the routing and aircraft as a PA28. Whilst no mode C was indicated they confirmed the aircraft was at 2000' on the Stansted QNH of 1017 and that it was a student pilot who had called them on becoming unaware of position. I asked Wattisham to descend the aircraft below 1500' as soon as possible as we were holding aircraft away from the final approach track of runway 22 and to confirm when the aircraft had done so. Three aircraft under the control of Essex Radar were given extended routings as a result of the infringement. Another aircraft was well ahead of the infringement and continued its approach as normal.
201512162	30/08/2015	EGTT : London (FIR)	Rhyl	1nm South	Other	Other	MOONEY	Reciprocating	1	Infringement of NOTAMed air display by an aircraft at approximately 1500ft.	The air display was protected by a NOTAM specifying protected airspace from surface to 3500ft amsl and 4nm radius from the datum on Rhyl seafront. As flying display director I was monitoring the flying display from the datum point when a member of the committee drew my attention to a light aircraft infringing the area directly to the south of the datum. The aircraft, later identified, as flying a left hand race track pattern at approximately 1500ft. It flew this pattern at least twice coming to within 1nm of display datum. An aircraft in the display holding area was asked to identify the aircraft and was able to report the registration to display control. Simultaneously, display control using a flight tracking app identified the aircraft. We tracked the aircraft for 10mins or so as it eventually left the area to the south. Fortunately, the aircraft was spotted and appropriate action was taken to prevent a more serious incident. The display was temporarily suspended and only resumed when we were confident that it was leaving the display airspace.

201512164	03/09/2015	EGTT : London (FIR)	EGKK (LGW): London/Gatwick	Bearing W Range 8nm	D	CTR	CESSNA	Reciprocating	1	Infringement of the Gatwick CTR (Class D) by a C172 squawking 3767. Standard separation maintained.	8nm west of the airport a 3767 squawk entered the CTR, height unknown. INT called KR to identify it using squawk ident and subsequently told them to instruct the aircraft to leave controlled airspace to the north immediately. GS Air called KR to get the details of the aircraft concerned. I stopped departures temporarily and restarted them when the infringer left to the north.
201512193	04/09/2015	EGTT : London (FIR)	EGHI (SOU): Southampton	14.4nm S	D	CTR	OTHER	Reciprocating	1	Infringement of the Solent CTA 2 (Class D) by two unknown aircraft in formation squawking 0011, indicating 2A climbing to 2900ft. Traffic info given to an inbound aircraft. Standard separation maintained.	A contact squawking 0011 was observed at Beaulieu tracking SE indicating 2A. Blind calls were made with no response. Bournemouth were contacted but were not working it. The contact continued SE and started to climb. It reached 2.9A over Newtown on the IOW, just on the edge of CAS. ***184G was inbound at this time. The inbound was on a visual approach and was warned about the infringer. As the infringer climbed into CAS, the inbound was told to turn base which it did. This kept it clear of the infringer.☐ Supplementary 09/09/15:☐ Was in contact with Southampton ATC remaining at 1700 - 1800ft i.e. below the 2000ft limit. Just before Beulieu I Asked Southampton if D037 was active (I actually meant D036) for the channel crossing, they did not know. Called Plymouth Mil who requested a transit altitude, I suggested 2,500ft and they cleared me to transit at that level. Keen to get to the transit altitude, I got almost to the southern edge of the class D airspace and started climbing a little too soon, I infringed the southern edge of the class D. My colleague following in a microlight was carrying a transponder, also was on Plymouth mil, and his xponder trace showed he did infringe the southern edge. Southampton could not contact either of us. At mid channel I got a message from Plymouth Mil to contact Southampton which I could barely receive, My colleague relayed it for me. We telephoned Southampton from Cherbourg. 1) Note to self not to get distracted by onward clearance from another station when under existing airspace restriction. 2) Plymouth to provide Southampton and Bournemouth with status of the D036 area so no need to transfer to another station when coasting out. 3)Fly with GPS which

201512398	05/09/2015	EGTT : London (FIR)	EGSS (STN): London/Stansted	Ware	D	CTA	OTHER	Reciprocating	1	Infringement of the Stansted CTA (Class D) by an unknown aircraft squawking 7000, indicating 1700ft, resulting in a loss of separation with an inbound B737. Aircraft identified as a Pioneer 300. CAIT activated.	I was just turning a B737 onto the R04 ILS when a Pioneer 300 entered the CTA at Ware indicating 1700 feet. I immediately made a blind call to the Pioneer 300 to see if he was on frequency. That's when the Luton controller realised that he was working the aircraft. Luton then descended the Pioneer 300 and put squawk 4670 on him. Supplementary 08/09/15: I was on duty as Luton Radar controller At about 1416 Pioneer 300 called and requested a basic service reporting at 1800ft routeing from a private site in Northampton to *****. I agreed a basic service and gave the Luton QNH. I had not yet issued a squawk and was vectoring aircraft for 08 at Luton when at about 1419 I heard the SS radar controller making a blind call to the Pioneer 300. I could now see on my radar that a return with mode S showing the Pioneer 300 was CAITing magenta in the EGSS SW stub. I asked the Pioneer 300 to confirm QNH, that he had ground contact, and to descend immediately to not above 1500ft as I believed him to be in CAS. He acknowledged, confirmed he had ground contact and descended out of CAS in a timely manner. A B737was establishing on the 04 ILS at EGSS, NE of, but diverging from the Pioneer 300 so avoiding action was not considered necessary. I told the Pioneer 300 to squawk 4670 to confirm identification, which he did. I then advised the Pioneer 300 of his position and warned him that he was tracking directly towards EG SX and advised that he contacted them or avoided their ATZ. He acknowledged this and left the frequency.

201512398	05/09/2015	EGTT : London (FIR)	EGSS (STN): London/Stansted	Ware	D	CTA	BOEING	Turbofan	2	Infringement of the Stansted CTA (Class D) by an unknown aircraft squawking 7000, indicating 1700ft, resulting in a loss of separation with an inbound B737. Aircraft identified as a Pioneer 300. CAIT activated.	I was just turning a B737 onto the R04 ILS when a Pioneer 300 entered the CTA at Ware indicating 1700 feet. Luton then descended the Pioneer 300 and put squawk 4670 on him. <input type="checkbox"/> Supplementary 08/09/15: <input type="checkbox"/> I was on duty as Luton Radar controller At about 1416 Pioneer 300 called and requested a basic service reporting at 1800ft routeing from a private site in Northampton to *****. I agreed a basic service and gave the Luton QNH. I had not yet issued a squawk and was vectoring aircraft for 08 at Luton when at about 1419 I heard the SS radar controller making a blind call to the Pioneer 300. I could now see on my radar that a return with mode S showing the Pioneer 300 was CAITing magenta in the EGSS SW stub. I asked the Pioneer 300 to confirm QNH, that he had ground contact, and to descend immediately to not above 1500ft as I believed him to be in CAS. He acknowledged, confirmed he had ground contact and descended out of CAS in a timely manner. A B737was establishing on the 04 ILS at EGSS, NE of, but diverging from the Pioneer 300 so avoiding action was not considered necessary. I told the Pioneer 300 to squawk 4670 to confirm identification, which he did. I then advised the Pioneer 300 of his position and warned him that he was tracking directly towards EGSX and advised that he contacted them or avoided their ATZ. He acknowledged this and left the frequency. <input type="checkbox"/>
201512403	05/09/2015	EGTT : London (FIR)	EGCC (MAN): Manchester/Intl	Northwich	D	CTR	OTHER	Reciprocating	1	Infringement of the Manchester CTR (class D) by an unknown aircraft showing as a primary contact only at approx 500ft. Aircraft identified as a microlight by an inbound B737. Standard separation maintained.	On 05L as Final Director I became aware of a primary contact, intermittent, just inside the zone, tracking southbound parallel with the low level corridor. The return was very slow moving, intermittent and moving with the wind direction. <input type="checkbox"/> Because of this I considered it to be spurious but mentioned it to ***816W who was inbound on the ILS. He replied that he could not see anything. He then mentioned that he could see a microlight in his 10 o'clock, which was in the approximate area where the return was, to the north of the final approach track, about 500agl. The pilot appeared completely unconcerned. The next inbound was some 10nm behind but the return had now passed south of the final approach and I assessed that the inbound would pass well to the north of the return. I monitored the return and the inbound a/c to make sure that this was the case. When I first noticed the return I tried a blind transmission and also asked APC S to do the same. He did receive a reply but it was from an a/c northbound in the LLR.
201512403	05/09/2015	EGTT : London (FIR)	EGCC (MAN): Manchester/Intl	Northwich	D	CTR	BOEING	Turbofan	2	Infringement of the Manchester CTR (class D) by an unknown aircraft showing as a primary contact only at approx 500ft. 201512409	06/09/2015	EGTT : London (FIR)	Solent CTA-2	IOW A023	D	CTA	EVEKTOR AEROTECHNIK	Reciprocating	1	Infringement of the Solent CTA-2 (Class D) by an unknown aircraft squawking 7000 at 2300ft. Aircraft identified as an EV97. Standard separation maintained.	EV97 (as indicated on Mode S) observed squawking 7000 routing west bound across the IOW A023, blind calls made-no response. HH contacted who were working the traffic, at this point EV97 entered Solent CTA-2 A023. No loss, no other traffic affected.
201512411	06/09/2015	EGTT : London (FIR)	MCT	7.5nm W	D	CTR	PIPER	Reciprocating	1	Infringement of the Manchester CTR by an unknown aircraft squawking 7366 indicating 1100ft. Aircraft identified as a PA28. AIW activated. Standard separation maintained.	I became aware of an aircraft just south west of EGCB, tracking SW towards the Manchester LLR. The aircraft was squawking 7366 [Manchester Listening Squawk]. Just before it reached the LLR, it turned south and tracked towards the north-west CTR boundary. I made a couple of blind transmissions to the aircraft but with no reply. No Mode S registration information was available. Just as it reached the CTR boundary I placed a check on departures and telephoned the AIR1 controller (23R SRO) to confirm the departure check and advise of the infringement.AIW then activated and I continued to call the aircraft, with no response. I telephoned Barton who passed the likely registration and details, but shortly <input type="checkbox"/> afterwards the aircraft turned west and exited the CTR into the LLR. There was no other traffic in the vicinity and hence no loss of separation occurred. After dealing with two IFR arrivals calling on frequency, I then free-called the unknown using the registration ***** as supplied by Barton. The pilot immediately responded and I placed him under a discrete Manchester squawk, thus identifying the aircraft. Around this time I also lifted the check on departures. I elected not to inform the pilot of the infringement, being concerned that it might cause him worry and distraction, but placed him under a Basic service and continued to monitor the flight until he requested to transfer to (I believe) the East Midlands frequency some 15 minutes later.

201512423	06/09/2015	EGTT : London (FIR)	EGHI (SOU): Southampton	15.2nm S	D	CTA	FLY BUY ULTRALIGHTS	Reciprocating	1	Infringement of the Solent CTA (Class D) by an unknown aircraft squawking 7000, indicating 2000ft. Aircraft identified as a Ikarus C42. Standard separation maintained.	At 1107z a contact was observed routing Eastbound at SAM 187R 15.2nm, Mode C indicating 2A climbing. Blind calls were made for the aircraft using the Mode S downlink callsign for an Ikarus C42. Bournemouth were contacted and they advised they were not in contact with the C42. The aircraft continued to climb to indicated 2.4A before leaving the lateral limits of Solent CTA-2. There was no other traffic affected. At time 1113z the C42 checked in on the frequency (now clear of controlled airspace), and was provided with a basic service before leaving the frequency for Sandown.
201512426	06/09/2015	EGTT : London (FIR)	EGKK (LGW): London/Gatwick	11nm ENE	D	CTR	CESSNA	Reciprocating	1	Infringement of the Gatwick CTR (Class D) by an unknown aircraft indicating 2200ft, resulting in a loss of separation with an inbound B737. Aircraft identified as a C150. Traffic info given.	Working as EGKK FIN with EGKK INT split. An aircraft wearing a EGLF east squawk was observed to enter the zone in the NE corner indicating 2200ft. A B737 was vectored away from the aircraft to the SW whilst EGKK INT called EGLF East. They stated that the aircraft was a student and was being descended to leave controlled airspace, which it then did. Once this had happened, the B737 was re vectored back onto the ILS establishing inside 10DME (this was coordinated with the tower). The aircraft was identified as a C150.
201512426	06/09/2015	EGTT : London (FIR)	EGKK (LGW): London/Gatwick	11nm ENE	D	CTR	BOEING	Turbofan	2	Infringement of the Gatwick CTR (Class D) by an unknown aircraft indicating 2200ft, resulting in a loss of separation with an inbound B737. Aircraft identified as a C150. Traffic info given.	Working as EGKK FIN with EGKK INT split. An aircraft wearing a EGLF east squawk was observed to enter the zone in the NE corner indicating 2200ft. They stated that the aircraft was a student and was being descended to leave controlled airspace, which it then did. Once this had happened, the B737 was re vectored back onto the ILS establishing inside 10DME (this was coordinated with the tower). The aircraft was identified as a C150.
201512430	05/09/2015	EGTT : London (FIR)	EGCC (MAN): Manchester/Intl	14nm NE	D	CTR	CIRRUS	Reciprocating	1	Infringement of the Manchester CTR (Class D) by an unknown aircraft squawking 7000, indicating 3000ft climbing to 3400ft. Aircraft identified as a Cirrus SR22. All departures stopped. Standard separation maintained.	I was working as the Approach South controller and vectoring on 05L single runway ops. I had noticed a 7000 squawk at 3500ft getting close to the boundary of controlled airspace at 3000ft. The contact was about 14miles to the East of Manchester tracking northbound towards DESIG. I tried blind calling this with no success. As it entered controlled airspace I noticed a DESIG about to roll so I stopped DESIG departures. I tried again to freecall the contact and got someone in to split the position. The contact then continued North and still unsure of intentions I stopped all departures. Upon trying the aircraft again it called up as a Cirrus SR22 which I then put on a squawk of 7354. This contact was identified and validated and on confirmation of being VFR was given a transit not above 3500ft. Departures were then restarted.
201512432	06/09/2015	EGTT : London (FIR)	EGLC (LCY): London city	5nm NE	D	CTA	GRUMMAN	Reciprocating	1	Infringement of the London City CTA (Class D) by unknown aircraft indicating 2200ft, resulting in a loss of separation. Avoiding action given to an outbound EMB190. Aircraft belived to be a Grumman AA5.	Shortly after taking over the position ***8734 became airborne from Runway 27, London City. At the same time I observed Infringing traffic to the north of London City tracking towards the City CTR and the outbound SID track of ***8734. I immediately co-ordinated with TC NE and attempted to obtain co-ordination with LL FIN by shouting across but was unsuccessful. When the *** 8734 called on the frequency I issued a heading of 360 which was planned to avoid the infringing traffic and the nearest LL inbounds (due to lack of co-ordination). I then managed to obtain co-ordination with LL FIN. Shortly thereafter TC NE called and offered climb for ***8734 which was accepted. ***8734 was vectored north then east (around the Infringer) and then co-ordinated off normal track with TC SE before transferring frequency. The Infringing traffic was observed to descend below the TMA but then enter the London City CTR passing through the final approach to runway 27 at approximately 2200ft.

201512432	06/09/2015	EGTT : London (FIR)	EGLC (LCY): London city	5nm NE	D	CTA	EMBRAER	Turbofan	2	Infringement of the London City CTA (Class D) by unknown aircraft indicating 2200ft, resulting in a loss of separation. 201512443	06/09/2015	EGTT : London (FIR)	EGMC (SEN): Southend	8nm SW	D	CTR	OTHER	Reciprocating	1	Infringement of the Southend CTR (Class D) and then the Southend CTA (Class D) by a CTSW squawking 3767 indicating 1400ft. Avoiding action given to an outbound aircraft. Standard separation maintained.	I was Southend Director and had released the ***49RV to depart Rwy24 on a Lydd PDR to DET climbing to 3000ft. I then noticed an aircraft showing as a CTSW on the display, and wearing the Redhill ATC conspicuity squawk code 3767, level indicated approximately 1400ft but did go up a little above this too. Both Southend Radar and Director positions put out multiple blind calls to the CTSW with no response. I contacted the Tower controller to check if the ***49RV was already departing, luckily it was still turning onto the runway, and so the Take-off clearance was cancelled. We contacted Redhill Tower who confirmed it was an acft that took off from them, and they tried to call the aircraft to instruct it to change frequency to Southend Director. However there was no response to their call. The aircraft proceeded east bound long the south bank of the River Thames before turning to overhead Stoke airfield, where the altitude indication reduced to 300ft before climbing out again. As the CTSW left the Southend CTR at Stoke, The ***49RV was released to depart again.□ The CTSW from Stoke tracked westbound and then climbed back into the Southend Control Area 1 at up to 1900ft before exiting the Southend CAS at 1655. During this time, the ***49RV given a further precautionary turn onto a heading of 110 degrees, as Thames Radar were unable to give any further climb through the Thames Gate. Climb to 5000ft was then given by Thames Radar and transferred to them. The pilot of the CTSW subsequently phoned after landing and was apologetic, said had been flying with a very old map, whilst demonstrating to a student how to approach Stoke airfield. No radar recordings or RT have yet been impounded, but are available for this within 30 days if required.

201512494	08/09/2015	EGTT : London (FIR)	EGGD (BRS): Bristol/Lulsgate	18nm ENE	D	CTA	VANS	Reciprocating	1	Infringement of the Bristol CTA by an unknown aircraft squawking 7000 indicating FL41 climbing. Aircraft identified as a Vans RV6. Standard separation maintained.	A 7000 squawk was seen approaching Bristol CTA8 at approx. 133kt southbound at 1710 .this aircraft appeared to be climbing and was already indicating FL41 climbing .It's mode S readout showed it to be a Vans RV6 Bristol QNH was at the time 1026. The radar filter converted the readout to altitude 4600ft and the aircraft was seen to climb to 4800ft whilst in a gentle orbit anticlockwise back to the northeast and exiting. The FIR, Kemble and Gloucester were telephoned to see if they were working the traffic. The aircraft was operating on the Gloucester frequency and subsequently called on the Bristol after instruction from Gloucester. The aircraft was on a navex. He was informed of the infringement and requested to call the Bristol ATC watch manager.
201512549	29/08/2015	EGTT : London (FIR)	EGSL : Andrewsfield	1nm N	D	CTR	PIPER	Reciprocating	1	Infringement of the Stansted CTR (Class D) by an unknown aircraft squawking 7000 indicating 1700ft. Aircraft identified as a PA28. CAIT activated. Standard separation maintained.	PA28 activated CAIT 1nm North of EGSL at 1700ft tracking East.
201512555	07/09/2015	EGTT : London (FIR)	Not specified		G	Danger area	TECNAM	Reciprocating	1	Infringement of active Danger Area EG D125 (Larkhill) by a Tecnam P2002 at 1600ft.	Tecnam P2002 entered D125 without clearance. P2002 called me on Bristol LARS (RAD2) 125.65Mhz for a service on route from **** to ****. The pilot reported his position at Old Sarum. I provided him with a Basic Service and asked him to squawk 5075 to enable me to monitor his flight. I eventually noticed his squawk which was overlapping with a 7000 contact in the centre of Salisbury Military Danger Area 125. I advised him of traffic in his immediate vicinity, alerted him of his position and instructed him to call Salisbury Ops immediately on frequency 122.750. He replied that the other traffic was in company with him. His track for **** appeared to be the fastest route out of the danger area so I did not give any turn instruction. The pilot had a very strong German accent making it difficult to understand each other. We both had to ask for repeat information. The pilot called back on my frequency saying he could not get any reply. Shortly afterwards Salisbury Ops called to say they could hear the aircraft trying to call them. I passed the aircraft details to them and took their number for the pilot to phone on landing. Although D125 was notified as being active up to 30,000ft firing had completed for the day shortly prior to the aircraft entering the area. The light aircraft were believed to be at A016, weather was good with clear visibility at Bristol. Salisbury Ops later advised me that the pilot had phoned them and apologised for his error. They would be taking reporting action.
201512556	09/09/2015	EGTT : London (FIR)	EGLL (LHR): London/Heathrow	18nm DME R/W09L	A	TMA	SLINGSBY	Reciprocating	1	Infringement of the LTMA (Class A) by a T67 at 3000ft, resulting in loss of separation with an inbound A320. Traffic info and avoiding action given.	A320 was being vectored onto final approach for 09L when an aircraft infringed the airspace 18nm west of Heathrow The infringing aircraft callsign □ T67 was at 3A and the A320 was told to continue through the localiser as avoiding action and traffic information was passed. The infringing aircraft then descended below 2.5A and left controlled airspace.

201512556	09/09/2015	EGTT : London (FIR)	EGLL (LHR): London/Heathrow	18nm DME R/W09L	A	TMA	AIRBUS	Turbofan	2	Infringement of the LTMA (Class A) by a T67 at 3000ft, resulting in loss of separation with an inbound A320. Traffic info and avoiding action given.	A320 was being vectored onto final approach for 09L when an aircraft infringed the airspace 18nm west of Heathrow The infringing aircraft callsign <input type="text"/> T67 was at 3A and the A320 was told to continue through the localiser as avoiding action and traffic information was passed. The infringing aircraft then descended below 2.5A and left controlled airspace.
201512557	09/09/2015	EGTT : London (FIR)	Detling		A	TMA	PIPER	Reciprocating	1	Infringement of the LTMA (Class A) by an unknown aircraft squawking 7000 climbing to 2800ft, resulting in loss of separation against an inbound EMB190. CAIT activated. Traffic info and avoiding action given.	Avoiding action against infringing traffic. EMB190 was vectored off DET for London City at 4000ft in usual way. CAIT then indicated traffic climbing into CAS airspace 2600 ft. As this is in tolerance The trainee gave CFE a vector too remain clear of the 7000 squawk. The contact was then seen to climb to 2800ft at which point a harder turn and then avoiding action was given. (This was prompted by myself) The conflict was over quickly and there was no further incident. <input type="text"/> Supplementary 11/09/15: <input type="text"/> I had selected QFE and had started my overhead join to land at **** I was concerned it was a busy circuit and so my vision was outside the cockpit there was a strong wind and I found it was difficult to maintain altitude due to how bumpy conditions were in flight. I should keep my altimeter set on QNH until well established in the circuit and only then set QFE.
201512557	09/09/2015	EGTT : London (FIR)	Detling		A	TMA	EMBRAER	Turbofan	2	Infringement of the LTMA (Class A) by an unknown aircraft squawking 7000 climbing to 2800ft, resulting in loss of separation against an inbound EMB190. 201512612	09/09/2015	EGTT : London (FIR)	EGNR : Hawarden	8nm E	A	TMA	CESSNA	Reciprocating	1	Infringement of the Manchester TMA (Class A) by a C172 squawking 4601, indicating 3600ft. Standard separation maintained.	A C172 departed at 17:51z on a standard VFR departure to the east with an initial altitude restriction of 1,500ft. The aircraft was being provided with a basic service and the altitude restriction was removed once the aircraft was airborne and the aircraft told to remain outside controlled airspace by the previous ADI controller. I took over the ADI position at 17:55z and observed the aircraft on the ATM at 17:58z to be at 3,600ft. An altitude report was requested and confirmed as 3,600ft. The aircraft was informed that the base of controlled airspace is 3,000ft and the aircraft immediately descended to leave controlled airspace.
201512625	08/09/2015	EGTT : London (FIR)	Not specified		G	ATZ	LINDSTRAND	None	0	Infringement of the Wittering ATZ (Class G) by a hot air balloon.	Hot Air Balloon in MATZ. Towards the end of the Wittering flying day, a Hot Air Balloon was seen to launch from an area North East of Wittering airfield - Approximately 290 degrees with an estimated range of 2.5nm. At the time of the first sighting, a single Tutor was recovering to the airfield from the North East Sector. Shortly after the first sighting, the balloon was seen to disappear into the cloudbase (MMS cloudbase recorder displayed main cloudbase approximately 1900ft above local ground level). The balloon was seen to drift Westerly and away from the airfield and was seen to enter cloud a second time at approximately 1745L. There was no radio contact with the balloon. <input type="text"/> Supervisor's Narrative: <input type="text"/> I witnessed the balloon as described above. The radar controllers were unable to determine how close the balloon flew to the airfield although normally the PSR would pick it up. It is possible that the balloon was also squawking but if the transponder was slightly weak or being masked it might not have been seen by the CWL SSR. However, Tutors in the WIT cct at 800' QFE are seen.

201512625	08/09/2015	EGTT : London (FIR)	Not specified		G	ATZ	GROB	Reciprocating	1	Infringement of the Wittering ATZ (Class G) by a hot air balloon.	Hot Air Balloon in MATZ. 201512629	09/09/2015	EGTT : London (FIR)	Red Arrows RA(T)		A	Restrict ed area	OTHER	Reciprocating	1	Infringement of Red Arrows RA(T) by two aircraft squawking 7000 at 2100ft. The Red Arrows display was delayed until the RA(T) was clear of the infringing aircraft. Traffic info given.	Infringement of Red Arrows RA(T) Airspace. The Red Arrows had planned an air display centred on Pangbourne, and published details of Restricted Airspace (temporary) in NOTAM J0651/15. When the airspace became active at 1155 there were 2 aircraft within the airspace, neither of which were talking to military ATC or Farnborough ATC. At 1155 I received a landline call from Farnborough ATC to inform me, based on data from their Mode S radar, that the aircraft inside the airspace were a Sportcruiser and (callsign ****). Callsign *** was from ****. A few minutes later Oxford ATC called and had obtained the same information from their Mode S radar. Sportcruiser entered the 6nm radius airspace from the east as the airspace became active at 1155. The aircraft flew from east to west, leaving the airspace at 1200. At no time did this aircraft speak to military ATC and was squawking 7000 throughout. Callsign *** entered the airspace from the south east at 1155 and flew in a north-westerly direction for approximately 3 miles. At this point the aircraft's squawk changed to 0440 (a Farnborough squawk), turned around and proceeded to exit the airspace to the south east at 1158. Throughout the period the Red Arrows were in contact with military Approach and were kept updated of the infringing traffic. The Red Arrows held to the south of the airspace until the RA(T) was clear of the infringing aircraft, which delayed the start of their display until 1201.☐ Appropriate CAA action being taken as a result of this incident.☐ Supplementary 18/09/15:☐ A Restricted Airspace (Temporary) - RA(T) - was established from 1155z to 1235z.
201512629	09/09/2015	EGTT : London (FIR)	Red Arrows RA(T)		A	Restrict ed area	OTHER	Unknown		Infringement of Red Arrows RA(T) by two aircraft squawking 7000 at 2100ft. The Red Arrows display was delayed until the RA(T) was clear of the infringing aircraft. Traffic info given.	Infringement of Red Arrows RA(T) Airspace. 201512632	10/09/2015	EGTT : London (FIR)	EGHI (SOU): Southampton	6.4nm NNW	D	CTR	PIPER	Reciprocating	1	Infringement of the Southampton CTR (Class D) by an unknown aircraft showing as a primary contact only, resulting in loss of separation with an outbound ATR72. Aircraft believed to be a PA18. Traffic info and avoiding action given.	At 1629z a primary only contact was observed approaching the Southampton CTR south east bound, approximately half a mile from the zone boundary. Departing traffic ATR72 (rwy 02) was initially given a precautionary right turn 110, which was upgraded to avoiding action with traffic information as the contact was observed entering the zone at SAM 350R 6.4nm. The contact was observed to turn and leave the zone to the north west. Military airfield was contacted by the radar co-ordinator (they did not believe they were in contact with the traffic). The contact was visually tracked to the north by the radar co-ordinator, who observed it with a squawk of 2676 mode C indicating 0.8A at time 1640z. Another military airfield was contacted when the contact was approximately 5nm north west of Thruxton, they advised that they believed the aircraft to be PA18 from a private site to ****.
201512632	10/09/2015	EGTT : London (FIR)	EGHI (SOU): Southampton	6.4nm NNW	D	CTR	ATR	Turboprop	2	Infringement of the Southampton CTR (Class D) by an unknown aircraft showing as a primary contact only, resulting in loss of separation with an outbound ATR72. Aircraft believed to be a PA18. Traffic info and avoiding action given.	At 1629z a primary only contact was observed approaching the Southampton CTR south east bound, approximately half a mile from the zone boundary. 201512724	10/09/2015	EGTT : London (FIR)	EGGP (LPL): Liverpool	10nm NE	D	CTR	PIPER	Reciprocating	1	Infringement of the Liverpool CTR (Class D) by a PA28 squawking 5054 indicating 1300ft. Standard separation maintained.	PA28 calls for a service but is unable to receive instructions from Liverpool Radar. Pilot commences an orbit north of Burtonwood VRP but inadvertently enters CAS without a clearance whilst orbiting. Pilot establishes radio communications with Liverpool and admits to entering the zone. The pilot is then allocated a squawk and given a clearance to cross CAS.
201512756	11/09/2015	EGTT : London (FIR)	Gamston	6nm N	D	CTA	PIPER	Reciprocating	1	Infringement of the Doncaster CTA (Class D) by an unknown aircraft squawking 3611, indicating 4500ft. Aircraft identified as a PA28. Standard separation maintained.	A 3611 squawk was observed close to the edge of controlled airspace with a Waddington squawk of 3611. The aircraft subsequently turned away. Several minutes later the same aircraft was observed inside Doncaster CTA-6 at 4500ft, the base is 2000ft. Waddington were called who explained that the aircraft was on a basic service. I asked for the aircraft to be transferred to me. The pilot called and the aircraft was identified. The pilot was informed of his infringement and he apologised. I subsequently spoke to the pilot after he had landed. He explained that he was training a student and they were conducting stalls. He said that they started in an area that he knew was outside CAS but thinks that at the altitude of 4500ft the wind was stronger than expected and that this pushed him into CAS, he also said that he was not aware this was happening. The pilot was aware of the airspace and the need to request a clearance to enter. The pilot was asked to fill in the Pilot Infringement Questionnaire.
201512759	11/09/2015	EGTT : London (FIR)	EGNE : Repton/Gamston	4nm W	D	CTA	PIPER	Reciprocating	1	Infringement of the Doncaster CTA by an unknown aircraft squawking 7000, indicating 2200ft established at 2400ft. Aircraft identified as a PA28. Standard separation maintained.	A 7000 squawk was observed 4nm west of GAM indicating 2200ft, the base is 2000ft. PA28 called at the same time, the aircraft was identified as the 7000 squawk and altitude established as 2400. I explained to the pilot that he had infringed CAS and cleared him to continue. I subsequently spoke to the pilot once he had landed. He explained that he had intended to remain below controlled airspace as he doesn't normally transit CAS. He was distracted and noticed he was climbing. The pilot fully understands the need to obtain a clearance before entering and accepts full responsibility. The pilot was asked to fill in the pilot infringement questionnaire.
201512770	12/09/2015	EGTT : London (FIR)	EGHI (SOU): Southampton	9nm SSW	A	Restricted area	TECNAM	Reciprocating	1	Infringement of the Red Arrows RA(T) at Southampton by an unknown aircraft squawking 0011, indicating 1500ft. Aircraft believed to be a Tecnam P92. Traffic info given.	I was working Southampton Radar 128.850 with the Red Arrows displaying over Southampton on a discrete frequency. At approx. 1450 UTC a 0011 squawk was observed in the vicinity of Cowes northwest bound indicating 1.5A. As the contact continued on track towards the RAT a number of blind calls were made without success. As the aircraft approached the RAT position reports were relayed to the Red Arrows in relation to the specified datum of the display. The aircraft entered the RAT and then began tracking south, at which time I believe it had established contact with Solent Radar 120.225. Supplementary 14/09/15: I was working in Solent Radar with the frequencies split, and Southampton Radar working the Red Arrows displaying at Southampton Docks. At approximately 1450 I observed a 0011 squawk in the vicinity of Cowes tracking towards the RA(T). I made blind calls to the aircraft, whose down linked mode S callsign was ***** followed by numerous 'Z's. I made blind calls using ***** and ***** in an attempt to raise the aircraft but there was no response. The aircraft entered the RA(T) and I continued to make blind calls advising the aircraft of the RA(T). Tecnam P92 eventually contacted me and I advised him of his likely position (as he was not positively identified) and suggested he track southbound maintaining VFR. I then suggested he track via Iymington and Stoney cross to avoid the lateral limits of the RA(T). Tecnam P92's details were passed to Bournemouth and once clear of the RA(T) the aircraft was transferred to Bournemouth Radar. Supplementary 18/09/15:
201512902	11/09/2015	EGTT : London (FIR)	EGGP (LPL): Liverpool	15nm SW	D	CTA	PIPER	Reciprocating	1	Infringement of the Liverpool CTA (Class D) by an unknown aircraft indicating 3200ft. Aircraft identified as a PA32. Traffic info given to an inbound aircraft. Standard separation maintained.	An infringing aircraft was identified 15Nm south west of EGGP at 3200ft tracking in a south easterly direction where the base of controlled airspace is 3000ft. My TACT stopped an I/b to **** off at FL90. I rang Liverpool to advise them the *** would be coming to them in the descent because of the infringer (which EGGP had noticed). I rang the FIR and gave them the position of the infringing aircraft and asked if they were in contact with it. The FIR thought this was the case and that it was I/b to **** so I asked them to ask the pilot to call PC W2 LAS when they landed which he did. the callsign of the aircraft was for a PA32 and I think he infringed CAS for around 3Nm.

201512902	11/09/2015	EGTT : London (FIR)	EGGP (LPL): Liverpool	15nm SW	D	CTA	UNKNOWN	Turbofan		Infringement of the Liverpool CTA (Class D) by an unknown aircraft indicating 3200ft. Aircraft identified as a PA32. Traffic info given to an inbound aircraft. Standard separation maintained.	An infringing aircraft was identified 15Nm south west of EGGP at 3200ft tracking in a south easterly direction where the base of controlled airspace is 3000ft. My TACT stopped an *** I/b to **** off at FL90. I rang Liverpool to advise them the *** would be coming to them in the descent because of the infringer (which EGGP had noticed). I rang the FIR and gave them the position of the infringing aircraft and asked if they were in contact with it. The FIR thought this was the case and that it was I/b to **** so I asked them to ask the pilot to call PC W2 LAS when they landed which he did. the callsign of the aircraft was for a PA32 and I think he infringed CAS for around 3Nm.
201513092	08/09/2015	EGTT : London (FIR)	EGVO (ODH): Odiham		G	ATZ	CESSNA	Reciprocating	1	Infringement of the Odiham ATZ (class G) by an initially non-squawking aircraft at approx 1200ft. Aircraft subsequently identified as a C152 and displayed a 0441 squawk.	A non-squawking aircraft was observed on radar entering the Odiham ATZ from the NE. One aircraft was recovering VFR from the NW at the time and another crossing the overhead NW-SE at 1600ft AGL positioning for an ILS to rwy 27. The Tower controller was visual with the aircraft and described it being a approx 1200ft AGL. Once the aircraft was approx 1nm N of the airfield tracking W it displayed the squawk 0441, traffic information was sought from Farnborough LARS West who identified it as a Cessna 152 at 1700ft AMSL and confirmed routing. Farnborough explained the aircraft had freecalled them from within our ATZ. The aircraft departed the ATZ to the north and returned to its destination without further incident. After landing the pilot contacted ATC and explained that they had made a navigational error. This was attributed to the fact they it was their first solo instructing flight and that they were unfamiliar with the airspace thus reducing their capacity.
201513096	09/09/2015	EGTT : London (FIR)	Pangbourne		G	Restrict ed area	PIPER	Reciprocating	1	Infringement of the RA (T) during airshow display by a PA28 at 2300ft.	A Restricted Airspace (Temporary) - RA(T) - was established from 1155z to 1235z, dimensions 6nm and 3400ft amsl. At 1211z during a Red Arrows display, PA28 contacted RAF Benson Zone to request a Basic Service and a MATZ crossing. A mode C squawk was issued and the aircraft was seen to be 3nm south of the edge of the RA(T). RAF Benson ATC made aircraft aware of the RA(T) and given avoidance advice. Despite this the aircraft maintained northerly track and penetrated the RA(T) by 1nm before subsequently turning away and exiting. This infringement compromised the safety of all display aircraft. □ Appropriate CAA action being taken.
201513115	19/09/2015	EGTT : London (FIR)	EGHI (SOU): Southampton	10nm N	D	CTA	TECNAM	Reciprocating	1	Infringement of the Solent CTA 5 and 3 (Class D) by an unknown aircraft squawking 7000 indicating 3700ft. Aircraft identified as a Tecnam P2002. Departure of an outbound delayed. Standard separation maintained.	At approximately time 1410 I observed a 7000 squawk indicating 3700 feet approaching the boundaries of controlled airspace (no Mode S available). I made a couple of calls to this aircraft, with no reply, and so attempted to see if it was one of many freecallers standing-by by issuing all of them a squawk. It remained on a 7000 squawk. Prior to it entering controlled airspace I asked my coordinator to instruct the tower ATCO to hold the outbound ***6TR on the ground. It entered controlled airspace 001 degrees from SAM at 10nm, indicating 3700 feet and tracked eastbound, north of Winchester. I continued to call the infringing aircraft and eventually a Tecnam P2002 called and said 'that's me'. I issued a squawk of 3677 and the 7000 changed to 3677. I told the pilot that he was inside of controlled airspace without a clearance, and asked for his details. The pilot responded with 'I'd like a Basic service outside of controlled airspace' to which I replied that he was already inside of controlled airspace. The pilot did not seem to understand this. Tecnam - Kemble to the Isle of Wight. After a long delay the ***6TR was released. Prior to GCWFS transferring frequency I asked him to telephone Solent Radar - which the pilot later did - he was asked to complete an infringement questionnaire.
201513117	17/09/2015	EGTT : London (FIR)	EGCC (MAN): Manchester/Intl	North of Northwich	D	CTR	PIPER	Reciprocating	1	Infringement of the Manchester CTR (Class D) by an unknown aircraft squawking 7351. Aircraft identified as a PA28. Standard separation maintained.	I was working App South in Rwy 23 Dual ops, at 1220 I observed a 7366 code on the eastern side of the LLR tracking northbound but very close to the edge of the corridor. I phoned Air 2 to make them aware of the possible zone infringer. □ The aircraft entered the zone just north of Northwich and continued to track northbound about 1nm inside the zone boundary. The info button on radar screen did not provide me with any callsign information. I transmitted for the aircraft to contact me, at first another aircraft answered but I concluded it was a different aircraft to the one I was looking for. □ PA28 called up and said he was a student pilot routing from **** to ****, I put him on code 7351 and he was identified inside the Manchester zone. I advised him of his position and asked him to track NW bound until back in the corridor and that I would tell him when he was there. He tracked W immediately and left the zone returning to the LLR where he continued northbound and left my frequency at 1233 for Warton. No separation was lost and no avoiding action was given.

201513125	19/09/2015	EGTT : London (FIR)	EGCF : Sandtoft	3nm NE	D	CTA	JODEL	Reciprocating	1	Infringement of the Doncaster CTA (Class D) by an unknown aircraft squawking 7000, indicating 2900ft. Aircraft identified as a Jodel D120. Standard separation maintained.	7000 squawk observed entering controlled airspace to the north east of Doncaster airport, indicating altitude 2900 feet. No traffic affected. Aircraft crossed the CTA approx 3nm N/E of EGCF and tracked north west. Blind call made on frequency, but no reply. Humberside called to assist, and identify aircraft using Mode S as a Jodel D120. Aircraft responded and was then identified and provided with a basic service as he was outside controlled airspace by this time. Pilot informed he was enroute to ****. No further info was requested as I could see that the aircraft was heading towards an area of high aerial activity. Pilot asked to call ATC after he had landed. EGCN 191350Z 20006KT 140V240 9999 FEW041 20/10 Q1026=.
201513140	19/09/2015	EGTT : London (FIR)	NOKIN		D	CTR	BEECH	Reciprocating	1	Infringement of the Manchester CTR (Class D) by a BE35 squawking 7000 at 3500ft.	Whilst scanning radar noticed magenta data block, 3.5A, approaching NOKIN, CAS base 3A, from the East. Pointed out infringer to Tac. Phoned EGGP: APP to see if a/c had called them, which it was not. Watched a/c continue Westwards till it left CAS. RPS at time was 1021 remaining the same on the hour, EGCC QNH 1025
201513141	20/09/2015	EGTT : London (FIR)	EGHI (SOU): Southampton	15nm South	D	CTA	CIRRUS	Reciprocating	1	Infringement of the Southampton CTA -2 (Class D) by a SR22 squawking 0450 and indicating 2200ft. Aircraft subsequently infringed CTA a second time.	I was supposed to be on a SCRATCOH break but had returned to the coordinator position due to the high traffic level in radar, as there were no other staff on duty to coordinate in my absence. During this time aircraft infringed Solent CTA-2 SWbound squawking 0450, indicating 2200ft. I called Farnborough but their assistant advised that they were no longer working the aircraft. Bournemouth were not working it either and blind calls were not answered. Shortly afterwards the same aircraft infringed CTA-2 again NEbound. I called Farnborough again and this time the assistant advised that they were actually working it. I requested that the aircraft be descended below 2000ft to leave the CTA, and then requested that it be transferred to Solent. Supplementary 20/09/15: At 1558 aircraft #0450 indicating 2.2A infringed CTA 2 southwest bound. At 1605 aircraft #0450 indicating 2.2A infringed CTA 2 northbound. Unable to provide more info due to workload at time and lack of staff available. This report is being written whilst on a Scratcoh break. Supplementary 21/09/15: I was working as the LARS West controller, the frequency exploded leaving very little time to validate and verify the traffic.At the time I believe I had run out of LARS squawks.At approx' 1600 the approach controller pointed out 0450 squawk had infringed the Solent Zone.I contacted the pilot and transferred him to 120.225.Aircraft was given a Basic service on first call to Farnborough.I did not manage to validate and verify the FPS due to workload.The last
201513145	19/09/2015	EGTT : London (FIR)	EGGW (LTN): London/Luton	5nm NNE	D	CTR	OTHER	Reciprocating	1	Infringement of the Luton CTR (Class D) by an unknown aircraft showing as a primary contact only. Traffic info given to two inbound aircraft. Further inbound aircraft delayed. Standard separation maintained.	Primary contact observed North of EGGW tracking SW. ***013 on final talking to Luton Tower, I contacted the tower and advised them of the infringer, given the relative speeds it was decided that ***013 should continue and be given traffic information. ***013 had already carried out a missed approach and there was concern an additional missed approach may cause further issues. ***56EL was positioning downwind right at 6000ft, traffic information was given and ***56EL passed 3/3.5 NM North of the infringing contact. Further inbound a/c were delayed. The infringing contact turned away from Luton airport and left CAS, disappearing from radar 8nm NW of EGGW. The tower observed a microlight type a/c.
201513145	19/09/2015	EGTT : London (FIR)	EGGW (LTN): London/Luton	5nm NNE	D	CTR	AIRBUS	Turbofan	2	Infringement of the Luton CTR (Class D) by an unknown aircraft showing as a primary contact only. Traffic info given to two inbound aircraft. Further inbound aircraft delayed. Standard separation maintained.	Primary contact observed North of EGGW tracking SW. ***013 on final talking to Luton Tower, I contacted the tower and advised them of the infringer, given the relative speeds it was decided that ***013 should continue and be given traffic information. ***013 had already carried out a missed approach and there was concern an additional missed approach may cause further issues. ***56EL was positioning downwind right at 6000ft, traffic information was given and ***56EL passed 3/3.5 NM North of the infringing contact. Further inbound a/c were delayed. The infringing contact turned away from Luton airport and left CAS, disappearing from radar 8nm NW of EGGW. The tower observed a microlight type a/c.

201513145	19/09/2015	EGTT : London (FIR)	EGGW (LTN): London/Luton	5nm NNE	D	CTR	BOEING	Turbofan	2	Infringement of the Luton CTR (Class D) by an unknown aircraft showing as a primary contact only. Traffic info given to two inbound aircraft. Further inbound aircraft delayed. Standard separation maintained.	Primary contact observed North of EGGW tracking SW. ***013 on final talking to Luton Tower, I contacted the tower and advised them of the infringer, given the relative speeds it was decided that ***013 should continue and be given traffic information. ***013 had already carried out a missed approach and there was concern an additional missed approach may cause further issues. ***56EL was positioning downwind right at 6000ft, traffic information was given and ***56EL passed 3/3.5 NM North of the infringing contact. 201513204	20/09/2015	EGTT : London (FIR)	EGHI (SOU): Southampton		D	CTA	EUROPA	Reciprocating	1	Infringement of the Southampton CTA (Class D) by a Europa at 3200ft.	Familiar with route, normally talk to Farnborough and Solent, Sunday; Farnborough busy so just listened also wife with me. infrequent patchy cloud at low level on departure, haze below. Expected it to thin by Reading, but increased height eventually to 3200 ft to stay in clear, ground visible regularly in patches. Intended to go under the 3000ft tab east of Solent and turned west in a clear area to reduce height. This was a poor choice of direction as I underestimated the distance west needed to lose height and so clipped the zone (by 10m according to my GPS log/plot) and 200ft above. I was already heading the away from the zone when Farnborough spoke to me and then I talked to Solent for a basic service. They informed me I had infringed but on my GPS I had only touched the line. Initially I climbed then headed slightly east before reducing height to below the cloud base and under the tab. □ I did know exactly where I was and what airspace there was. It would have helped if I had used the listening squawk as I see there is one for Solent, I will do so in future. It was my error but my suggestion would be to simplify the airspace - numerous wedges and slithers of airspace at different heights particularly for the regional airports is generally very hard to work with. For the controller to declare an infringement when I touched the line and was already heading away seemed a bit heavy handed (my strip is under Lutons' CTA).

201513205	21/09/2015	EGTT : London (FIR)	Ashton in Markerfield		D	CTR	PIPER	Reciprocating	1	Infringement of the Manchester CTR (Class D) by an aircraft initially squawking 7000 at 1600ft.	At time 13:25 a 7000 squawk triggered the AIW in the Ashton in Makerfield area. Northern end of LLR/ Tracking north west. 1600ft and climbing. I rang EGCB and they knew nothing. After 2nd blind call and aircraft responded. I advised him to change squawk to 7350. The radar return then disappeared. I advised the pilot that I could not see him. The radar return eventually came back. I told the pilot about the event and asked him to call the watch manager on arrival. I am unsure if I offered him a service after I had identified him. The pilot thought that had climbed appropriately. No effect on EGCC traffic
201513363	23/09/2015	EGTT : London (FIR)	Q41	South of THRED	A	Airway - ATS Route	CESSNA	Reciprocating	1	Infringement Airway Q41 by an unknown aircraft squawking 1177 at approx FL43 climbing to FL53. Aircraft identified as a C182. Standard separation maintained.	I was working as the Hurn/Seaford planner and witnessed an aircraft squawking 1177 enter the airway Q41 south of THRED heading north. When I first noticed it, it was at about FL43 but it continued climb to about FL53 before turning out of the airway to the west. The squawk changed shortly after I noticed it to 7363 and whilst I was trying to ascertain who the squawk was affiliated with, Solent called to ask if we knew about it. They thought it was a Bournemouth squawk and then confirmed this with a phone call. It sounded to me, through what Solent said, that Bournemouth believed the aircraft to have been released by us. However no such release was given.
201513368	23/09/2015	EGTT : London (FIR)	GWC	Bearing SW Range 15nm	A	Airway - ATS Route	CESSNA	Reciprocating	1	Infringement of an Airway by a C172 at FL145. Mode S return disappeared and returned showing 000. Traffic info given.	During a busy and complex period characterised by the garbling of labels to the SW of GWC, I was advised as HRN Planner by TC SW that an infringer:☐ had appeared in confliction with an aircraft inbound to EGKK. The height readout indicated the aircraft to be at FL145 where the base of CAS is FL105. I immediately informed the Tactical controller and advised them to stop descent and turn the aircraft to avoid the return. As a result of the added complexity of avoiding this aircraft the sector was split. The height readout of the unknown aircraft then disappeared and returned indicating '000'. The aircraft was identified from its Mode S address and tracked to EGKA. The aircraft is an unpressurised Cessna and is thought to have been operating low level with a spurious height readout. ATC at EGKA were asked to advise the pilot of the issue.☐ Supplementary:☐ NATS have spoken to the owner who has confirmed a transponder fault. NATS recommended that a/c is grounded until transponder has been fixed.
201513368	23/09/2015	EGTT : London (FIR)	GWC	Bearing SW Range 15nm	A	Airway - ATS Route	AIRBUS	Turbofan	2	Infringement of an Airway by a C172 at FL145. 201513672	25/09/2015	EGTT : London (FIR)	TIMBA	Bearing 180 Range 6nm	A	TMA	AVIONS ROBIN	Reciprocating	1	Infringement of the London TMA (Class A) by a DR400 squawking 1177 at 5700ft. Traffic info given. Standard separation maintained.	Working as EGKK INT with the sector fully band boxed and training a student. A FIS squawking aircraft was observed to climb into controlled airspace 6nm south of TIMBA whilst this was happening a B737 checked in on the frequency. The student hadn't noticed the infringing aircraft and descended the B737 to a conflicting level. I immediately stopped the B737 of at FL110 which meant separation was kept. I spoke to the FIR and they advised me that they had spotted this and informed the FIS aircraft of the airspace bases and the aircraft descended correctly.☐ out of controlled airspace. There was no further issue.☐ Supplementary 26/09/15:☐ 0920z DR400 called on frequency on 124.6 routing at FL55. The a/c was placed on a 1177 squawk and given a basic service. Aircraft said he was routing via SFD and confirmed that he would be remaining outside controlled airspace. He was given the London QNH. As aircraft ☐ passed SFD he requested a check on the QNH and when asked stated that he was at 5700' altitude. He was informed of the base of controlled airspace in that area and said that he would descend. A few moments later KK director phoned to say that the a/c had infringed. Aircraft descended to 5000' then later 4500'. Aircraft transferred to EGKA at 0949z.

201513672	25/09/2015	EGTT : London (FIR)	TIMBA	Bearing 180 Range 6nm	A	TMA	BOEING	Turbofan	2	Infringement of the London TMA (Class A) by a DR400 squawking 1177 at 5700ft. Traffic info given. Standard separation maintained.	Working as EGKK INT with the sector fully band boxed and training a student. A FIS squawking aircraft was observed to climb into controlled airspace 6nm south of TIMBA whilst this was happening a B737 checked in on the frequency. The student hadn't noticed the infringing aircraft and descended the B737 to a conflicting level. I immediately stopped the B737 of at FL110 which meant separation was kept. I spoke to the FIR and they advised me that they had spotted this and informed the FIS aircraft of the airspace bases and the aircraft descended correctly.□ out of controlled airspace. There was no further issue.□ Supplementary 26/09/15:□ 0920z DR400 called on frequency on 124.6 routing at FL55. The a/c was placed on a 1177 squawk and given a basic service. Aircraft said he was routing via SFD and confirmed that he would be remaining outside controlled airspace. He was given the London QNH. As aircraft □ passed SFD he requested a check on the QNH and when asked stated that he was at 5700' altitude. He was informed of the base of controlled airspace in that area and said that he would descend. A few moments later KK director phoned to say that the a/c had infringed. Aircraft descended to 5000' then later 4500'. Aircraft transferred to EGKA at 0949z.
201513688	26/09/2015	EGTT : London (FIR)	EGHI (SOU): Southampton	CTA 2	D	CTA	VANS	Reciprocating	1	Infringement of the Southampton CTA 2 (Class D) by an unknown aircraft squawking 7000. Aircraft identified as a Vans RV6.	A 7000 squawk was observed departing **** and tracking SW, gradually routing closer to CTA-2. Blind calls were made and contact established shortly after the aircraft had entered the CTA. Aircraft was Vans RV6. Transit clearance issued.
201513690	26/09/2015	EGTT : London (FIR)	Solent	CTA 5	D	CTA	PIPER	Reciprocating	1	Infringement of the Solent CTA 5 (Class D) by a PA28 at 3000ft. Traffic info given. Standard separation maintained.	CTA-5 infringement. PA28 had called on frequency but had been told to standby due to workload as I was trying to catch up after another infringement. I had not got back to PA28 yet, when the tower ATSA called me to warn that PA28 was about to infringe to the north of the CTA. My attention had been to the south of the airfield and so I had not noticed PA28s' approach. I called the aircraft as it infringed the CTA and eventually issued a transit clearance once I had got its details. An inbound aircraft was informed of the aircraft's presence but not given avoiding action due to more than 3nm separation existing, and the fact that the aircraft was already on my frequency.
201513699	26/09/2015	EGTT : London (FIR)	EGMC (SEN): Southend	CTA 1	D	CTA	MEDWAY	Reciprocating	1	Infringement of the Southend CTA 1 (Class D) by a microlight at 1900ft. Standard separation maintained.	Airspace infringement CTA1. Microlight observed on mode S tracking beneath CTA1 north bound at alt 1500ft. Microlight was then observed climbing into CTA1 at (513322N 0002763E). Blind transmissions made on Southend Director on 132.450MHz and Southend Radar on 130.775 MHz Runway 06 in use, but no traffic affected.
201513703	27/09/2015	EGTT : London (FIR)	WHI		D	CTR	FLY BUY ULTRALIGHTS	Reciprocating	1	Infringement of the Liverpool CTR (Class D) by an unknown aircraft squawking 7000, indicating 2800ft. AIW activated. Standard separation maintained.	Infringer at WHI. While on duty as APP South controller I was alerted by the AIW tool to an infringer, squawking 7000 and indicating 2800', in the WHI area, at approx 1437 utc. I ascertained its callsign, Ikarus C42, from the MODE S tool. My immediate concern was for its impact on Liverpool traffic and WAL sector. I phoned Liverpool who had no knowledge of the a/c, and was phoned by WAL sector, who agreed to phone Hawarden. The a/c turned towards the low level route and I applied checks to westbound departures. The a/c called me about one mile south of the LLR. I instructed the a/c to descend and operate in the LLR, not above 1300'.

201513705	27/09/2015	EGTT : London (FIR)	REXAM		A	TMA	CIRRUS	Reciprocating	1	Infringement of the Manchester TMA (Class A) by a SR22 at 4700ft. SR22 subsequently infringed CAS again approx 20mins later. CAIT activated. Standard separation maintained.	I was seated at OP29D CAIT activated to indicate SR22 (tracking North-West) infringing CAS around REXAM at 4700ft. Airway Base 4500ft. Approximately 20 minutes later SR22 infringed CAS again (tracking South-East) between 4600ft and 5300ft. On both occasions airways traffic was vectored by Tactical Controller to ensure the radar blips did not merge with the traffic being more than 5000ft above the infringing aircraft. Liverpool, Hawarden and London FIR were not in contact with SR22. Aircraft on 7000 squawk.
201513707	27/09/2015	EGTT : London (FIR)	EGGW (LTN): London/Luton	CTA	D	CTA	EVEKTOR AEROTECHNIK	Reciprocating	1	Infringement of the Luton CTA (Class D) by an unknown aircraft squawking 7000 at 3400ft. Aircraft identified as an EV97. Departures were stopped as a precautionary measure. Standard separation maintained.	At time 08 19 a 7000 squawk was observed entering the Luton CTA at 3.4A tracking south. Mode S identified it as EV97. It continued to descend until it left the zone. Departures were stopped as a precautionary measure.
201513710	07/09/2015	EGTT : London (FIR)	Not specified		D	CTR	OTHER	Reciprocating	1	Infringement of the Manchester CTR (Class D) by an unknown aircraft squawking 7000, climbing above 1300ft. Aircraft identified as a Gyroplane. Standard separation maintained.	Zone infringement Gyroplane. I was working as Approach South controller. 05 dual operations moderate traffic levels. At approximately 1300 I noticed a 7000 return in the LLR near Thelwall was infringing the CTR by climbing above 1300'. Fin Dir had traffic on a closing heading to 05R from the south. I pointed the infringing traffic out to FIN DIR and measured the lateral separation at 5.3nm. I used Mode S to find the callsign of the infringer and made multiple calls to Gyroplane but with no success. I contacted Barton to see if Gyroplane was in contact with them, it was not at that time but did land at **** later. A westbound departure had just become airborne, the departure was transferred to PC before I could intervene, PC were able to maintain more than required separation against the infringer. At approximately 1304 Gyroplane departed controlled airspace and continued on track to land at ****. The pilot of Gyroplane subsequently telephoned the ATC WM.
201513772	26/09/2015	EGTT : London (FIR)	REXAM	5nm SW	A	TMA	JODEL	Reciprocating	1	Infringement of the Manchester TMA (Class A) by a Jodel DR1050 indicating 4700ft. CAIT activated. Standard separation maintained.	I was seated at OP29D. CAIT activated showing a Jodel DR1050 infringing controlled airspace near REXAM between 4600ft and 4700ft. Base is 4500ft. Manchester QNH 1029. London FIR did not have the aircraft on their frequency. No traffic affected.
201513787	28/09/2015	EGTT : London (FIR)	Middlewich		D	CTR	ROBINSON	Reciprocating	1	Infringement of the Manchester CTR (Class D) by an unknown aircraft squawking 7000, indicating 1200ft. Aircraft identified as an R44. AIW activated. Standard separation maintained.	At 1735, an R44 called me for a Basic service. I told him to standby, since I was busy dealing with aircraft in the hold - due to an aircraft having diverted back with an instrumentation problem. Approx two minutes later I noticed a 7000 squawk a few miles to the south of Middlewich heading towards the CTR. I therefore asked the R44 to pass his details and issued a squawk of 7350. The aircraft entered the CTR for a few seconds before the squawk could be observed, causing the AIW to alert for a radar sweep or two. Once the aircraft had been identified I informed him that he had infringed CAS and got him to head west to leave CAS - whilst confirming his level of 1200ft. Once in the middle of the LLR I got the aircraft to track north. From then on his navigation appeared to be ok.

File number	UTC date	Flight phase	Location name	Location Information	FIR/UIR name	Manufacturer/model [Make]	Propulsion type	Number of engines	Headline	Narrative text
199601218	10/04/1996	En route	Cranfield (CIT) NR		EGTT : London (FIR)	CESSNA	Reciprocating	2	Other Occurrence : Problems with both engines reported. Mayday call. RH engine shutdown on landing.	Radio transmissions distorted. Fuel selector problem suspected. A/c subject to rigorous ground & air tests - no fault found & no further problems experienced. CAA CLOSURE: Hazard adequately controlled by maint org actions.
199602774	08/07/1996	En route	WILTSHIRE		EGTT : London (FIR)	BEECH	Reciprocating	2	UK Reportable Accident : Engine failure due fuel starvation. Forced landing. 1 minor injury.	The pilot had not flown this type of aircraft for six years. A short pre-flight ground briefing was given by the aircraft operator. The aircraft was fuelled to full tanks prior to departure from Bournemouth to Dublin. The outbound flight was conducted using fuel from the main tanks only. On the return sector, the main tanks were again used. At the top of climb, the pilot selected the fuel quantity gauge switch to the auxiliary position, under the misapprehension that this would transfer fuel from the auxiliary tanksto the main tanks. Fuel starvation eventually occurred onboth engines and the pilot carried out a forced landing. On selecting the landing gear down and full flap, the aircraft would not glide to the intended point of touchdown. Instead it impacted a cultivated field on a hillside with ahigh vertical speed. See AAIB Bulletin 12/96, Ref: EW/C96/7/13.
199603026	06/07/1996	En route	WESTON ON THE GREEN		EGTT : London (FIR)	BRITTEN NORMAN	Turboprop	2	Other Occurrence : Both engines flamed out due to icing &would not restart. Forced landing completed successfully.	Opr has reviewed relevant flying instructions & drawn crews attention to anti-icing precautions detailed in flight manual. CAA has brought incident to notice of other UK oprs & established that flight manual adequately covers situation. CAA CLOSURE: Hazard adequately controlled by actionsstated.
199603518	12/08/1996	En route	IRISH SEA		EGTT : London (FIR)	PIPER	Reciprocating	2	Other Occurrence : Both engines lost power.	AAIB Field investigation. Fuel distribution prior to flight was 350 litres in inboard tanks & 30 litres in outboardtanks in accordance with company procedures, whereby total fuel required for flight is contained in inboard tanks with a small amount in outboard. Pilot, having assured himself that fuel quantity & distribution were correct, completed pre-flight checks & departed. Take off & initial transit were uneventful & at 2000ft a/c was cleared by Ronaldsway ATC under VFR to position for R/W35. A short time latertright engine began to misfire. Pilot selected both emergency pumps 'on' & engine operation returned to normal. Pilot then noticed right boost pump annunciator was illuminated. Right engine began misfiring again with no other indications. Having not increased power on left engine a/c was now descending. Informed ATC of intention to shutdown engine & was offered vectors to R/W26 to reduce ground track. Passing 400ft advised ATC that both engines were running roughly. Appropriate emergency services alerted. At 300ft pilot noticed both fuel pump annunciators were illuminated, checked fuel selectors & both were set to outboard tanks, repositioned selectors to inboard tanks & both engines recovered. ATC informed, a/c climbed to 1000ft & normal landing made. Both pre-flight & pre-take off checks require fuel selectors to be positioned for inboard tanks. Pilot doesnot remember ever selecting tanks to outboard position. See AAIB Bulletin 11/96, Ref: EW/C96/8/7. Opr's fuel checking procedures have now been amended. CAA CLOSURE: Hazard adequately controlled by opr's actions.
199604572	10/10/1996	En route	STRUMBLE (STU)		EGTT : London (FIR)	BOEING	Turbofan	4	Other Occurrence : Double engine rundown - nr4 engine shutdown. "Mayday" declared, fuel dumped & a/c returned. Flight crew error.	Rate of climb reduced to less than 500fpm at FL290 & shortly afterwards nr1 engine EPR began to fluctuate downwardsto approx 1.32 EPR. Manipulation of thrust lever gave no response. At approx same time nr4 engine began to run down- as both nrst1 & 4 engines ran down a "mayday" was declared. Multi-engine shut down drills carried out & after checklist items actioned, nr1 engine re-started on 3rd attempt- nr4 engine would only start with high EGT & low RPM & remained like that with no thrust lever response, so was shut down again. Fuel jettisoned, a/c returned & a 3-enginedlanding carried out. Subject to AAIB Field investigation,which reported incident was caused by the use of incorrect fuel system selections (AAIB Bulletin 12/96). CAA Closure: Appropriate personnel action taken by opr, plus Flight Crew Notice issued, Ops Manual and crew takeoff brief amended. Opr a/c fuel system mod action pending.
199605617	21/11/1996	En route	SHAWBURY (SWB)		EGTT : London (FIR)	DASSAULT	Turbofan	2	Other Occurrence : LH engine flamed out at FL325 (n climb to FL330) - "Mayday" declared. P3 line blocked.	A/c instructed to squawk emergency & D&D advised. A/c given range & bearings to diversion airfields but in meantimeengine successfully relit (a/c having descended to FL100)- pilot terminated emergency & a/c returned to base. Subsequent investigation found P3 line to FCU contaminated by an unknown substance - cleaned, ground runs satis. CAA Closure: Appropriate action taken by opr.
199702840	12/06/1997	En route	Luton (LUT) 1.5 SE		EGTT : London (FIR)	GRUMMAN	Reciprocating	2	Other Occurrence : Double engine failure. Forced landing in field. No damage or injuries.	CAA Closure: Appropriate CAA action taken.
199705808	06/11/1997	Take-off	BIRMINGHAM		EGTT : London (FIR)	BAC	Turbofan	2	Other Occurrence : RTO at approx 60kts due both engines slow to accelerate, followed by LH engine power decrease towards 80% N1. No fault found.	RH engine eventually achieved 100% N1, LH engine achieved95% N1 but then power decreased towards 80% N1. No fault found on investigation, however nr1 FCU changed - no further reports. See also 97/00180 & 97/04819. CAA Closure: Appropriate action taken by opr.
199706178	26/11/1997	En route	London-Heathrow - LHR		EGTT : London (FIR)	BAC	Turbofan	4	Other Occurrence : Uncommanded movement of secondary nozzles towards reverse thrust position on 2 engines. Positionmonitoring instrumentation - overheated.	During engineering test flight following intercheck, the indication system on nr1 engine showed thrust reverser secondary nozzle move uncommanded towards reverse thrust position with no wind down indication - precautionary engine shutdown carried out. Shortly after (at Mach 1.1), nr2 engine secondary nozzle also observed to move (uncommanded) towards reverse thrust position - precautionary engine shutdown considered but engine self recovered within 90 secondsand subsequent operation normal until landing when throttle baulk system was found to be slow to operate. Subsequent inspection found evidence of overheating in the nr1/nr2 thrust reverser bay due to air leaks from the telescopic tubes carrying the P3 muscle air to the air motors. The cause of the thrust reverser malfunctions was due to the consequential overheating of the thrust reverser position monitoring instrumentation in the thrust reverser bay. To prevent a recurrence, the opr has carried out a fleetwide check of the telescopic ducts following which routine checks are to be carried out at every 'S' Check; amended the workshopprocedures and component maintenance manuals (CMM) to ensure correct assembly and testing of the telescopic ducts before the engine is released from overhaul and has carriedout the embodiment of major modification AAN26461 that replaces the 27 degree switch pack and provides a bite checkindication in the cockpit. CAA Closure: Appropriate action taken by opr.
199706318	06/12/1997	En route	SOUTHAMPTON (SAM)		EGTT : London (FIR)	EMBRAER	Turbofan	2	Other Occurrence : Transient double engine FADEC failure indications during stall recovery on air test.	Amber EICAS warning messages "E1 CTL A+B FAIL" & "E2 CTL A+B FAIL" appeared simultaneously during two 9deg flap/gear up configuration stall manoeuvres. No other messages present & FADEC (full authority digital engine control) messages self-cleared within 5 seconds. Engine response appeared normal as thrust was applied in stall recovery. Messagesdid not occur during stalls with 0deg flap/gear up or 45deg flap/gear down configurations. CMC (central maintenancecomputer) information to be analysed. Investigation progressed under 97/06128. See also 97/04849 & 98/02484.
199802484	10/05/1998	En route	MANCHESTER (MCT)		EGTT : London (FIR)	EMBRAER	Turbofan	2	Other Occurrence : "E1 CTL A FAIL" & "E2 CTL A FAIL" warnings illuminated during climb in icing conditions. Unable to reset either FADEC.	Recurring fault. FADEC (full authority digital engine control) successfully reset using emergency checklist once a/c clear of icing conditions. Investigation progressed under 97/06128, see also 97/04849 & 97/06318.
199803264	21/04/1998	Approach	Luton (LUT) (Bedfordshire)		EGTT : London (FIR)	SHORT	Turboprop	2	Both engines cycled in & out of autofeather in a synchronised manner - no yaw but small pitch changes as engines surged with prop rpm & torque fluctuations.	Propeller rpm reduction on both sides approx 300rpm belowmaximum position of 1675rpm. Failure analysis conducted by aircraft manufacturer found no defects that could cause dual autofeather. However, misrigged microswitches on leftand right throttles could result in one engine cycling inand out of autofeather but with both autofeather arm indicators illuminating. This condition would match the symptoms reported and is supported by the results of the operator's action in adjusting these microswitches which appearedto cure the problem.☐ CAA Closure: Hazard controlled by action stated.
199903175	24/05/1999	En route	HAWARDEN 12S (ZZ)		EGTT : London (FIR)	BAE	Turboprop	2	Other Occurrence : Suspected double engine power loss during descent. Landed safely.	On passing 4500ft, with both engines set to 15% torque & anti ice & igniters on in light wet precipitation, crew alerted by change in engine note. Both torque indications had fallen to below 0%. Anti ice & fuel pumps confirmed as on & crossfeed confirmed shut/off. Power levers advanced & after approx 3-4 seconds engines responded immediately. Despite extensive trouble shooting on this engine, no conclusive fault has ever been found. Since the occurrence was reported the aircraft has flown in excess of 2000 hours without any further fault of this kind. Considered a random event with no further action appropriate.☐ CAA Closure: The hazard is controlled by the actions stated above.
199907309	21/10/1999	En route			EGTT : London (FIR)	AIRBUS	Turbofan	2	RH engine low oil quantity warning during cruise at FL190, engine shut down. Inspection found significant oil leak due oil tank sight glass cracked.	Sight glass changed, subsequent ground runs satisfactory.
199908292	03/12/1999	Take-off	Teesside (TD) (Durham)		EGTT : London (FIR)	ATR	Turboprop	2	Nr2 engine shut down following oil pressure warnings. A/creturned.	Brief Red Warning on CCAS during climb out. Engine parameters & systems appeared normal but a few moments later local Alert illuminated on nr2 engine & oil pressure needle fluctuated. CCAS warning for nr2 engine oil then activated & nr2 engine was shut down. A/c returned & single engine landing completed with emergency services on standby. Initial engine inspection carried out & engineer confirmed thatthere appeared to be no oil visible in sight glass. Oil system replenished & ground runs carried out - no leaks apparent. Low oil level attributed to poor oil system servicing due to lack of facilities at various line stations. Line stations are now equipped with access equipment for oil system servicing & PDI sheets annotated to report system servicing. CAA Closure: Hazard adequately controlled by existing requirements & procedures.

199908908	26/12/1999	En route	Manchester (MCT) (Greater Manc	2 N	EGTT : London (FIR)	PIPER	Reciprocating	2	Double engine failure. Mayday call. Diversion initiated. Engines restarted, descended to FL60 & flight continued to destination. Landed safely.	Further investigation established that the a/c had suffered rough running on both engines after encountering unexpected icing conditions. The pilot delayed selecting alternate air intakes & transmitted a Mayday call before completing the relevant checklist. Appropriate personnel action/re-training initiated & notice issued to remind pilots of need to select alternate air when flying in icing conditions. CAA Closure: Hazard adequately controlled by operator's action.
200000201	18/01/2000	En route	Llanbedr (Gwynedd)		EGTT : London (FIR)	CESSNA	Reciprocating	2	Double engine failure. Mayday call. Forced landing short of R/W. No reported damage or injury.	AAIB AARF investigation. In level flight at FL80 the left engine stopped. The pilot secured the engine & broadcast a MAYDAY call. He was instructed to squawk 7700 & to transfer to the emergency frequency 121.5 MHz. While the pilot was carrying out these actions the right engine also stopped. He could see Llanbedr airfield on the coast below & elected to make an emergency landing. The weather conditions were clear & the surface wind was less than 5kt. Llanbedr ATC was alerted to the situation by observing the emergency squawk on radar & hearing the transmissions on 121.5 MHz. They contacted the D&D centre & were handed control of the a/c. They then made contact with the pilot & provided details of the airfield. The pilot commenced a visual approach to R/W36 but realised that he was going to land short of the R/W. He informed ATC that he would be landing in a field outside the airfield boundary & they advised the AFS. The a/c landed in the field with no damage or injury. The a/c was recovered to the airfield & flew out the next day. The pilot stated that he had mismanaged the fuel system & had allowed the auxiliary fuel tanks, from which the engines were feeding, to run dry. The main tanks of the a/c contained sufficient fuel for the planned flight to Ireland. The pilot had logged some 350 hours of flight time on twin engine a/c but was not very experienced on this type. The Cessna 310 fuel system is designed such that the auxiliary tanks should be used during cruise flight & the main tanks may be used at any time. Excess fuel that is not required by the engines when feeding from the auxiliary tanks is returned into the main tanks. Thus the endurance of the auxiliary tanks may be considerably less than the actual contents at the start of the flight. The fuel gauges do not necessarily display the tank from which fuel is being used & need to be correctly selected. These factors can cause confusion to a pilot who is not very familiar with the system operation. See AAIB Bulletin 3/2000, ref: EW/G2000/01/11. CAA Closure: No CAA action appropriate.
200000480	29/01/2000	En route	London-Heathrow - LHR		EGTT : London (FIR)	BAC	Turboprop	4	"Pan" declared for expeditious approach due to engine shut down and insufficient fuel remaining for extended hold. BPDA failed.	Nr3 engine reverse light flashed as take off rating was selected during approach checks. ASOV stopped movement of reverse buckets at 36deg. - engine was shut down. "Pan" declared because a/c had sufficient fuel for a 5min hold and the average hold reported by ATC was 15mins. Uneventful three engine landing. Investigation found torque motor on BPDA failed. The torque motor controls the Directional Control Valve (DCV) to operate the bucket open or closed. A new standard BPDA (p/n 126464-2) is to be released. CAA Closure: Crew actions were in line with FM for precautionary engine shutdown, and the fault was rectified prior to returning the aircraft into service.
200001693	19/03/2000	En route	Ivybridge (Devon)		EGTT : London (FIR)	OTHER	Reciprocating	1	UK Reportable Accident : Engine failure. Forced landing. Extent of damage unknown. Serious injury to 1 POB.	BMAA investigation.
200001828	21/03/2000	En route	Isle Of Man (IOM) (Isle of Man)		EGTT : London (FIR)	EMBRAER	Turboprop	2	LH engine low oil pressure & fluctuating oil temperature indications. Engine shut down. A/c returned & landed safely with AFS in attendance.	No fault found.
200002006	27/03/2000	En route	English Channel (English Channel)		EGTT : London (FIR)	BOLKOW	Turboshaft	2	Nr2 engine mag plug capion illuminated. Engine shut down. A/c returned & landed safely.	Both mag plugs checked - single splinter found on upper plug. Engine ground run completed satisfactorily.
200002387	13/04/2000	En route	BRECON (BCN) (Glamorgan)	30 N	EGTT : London (FIR)	BAE	Turboprop	2	Engine oil pressure problem. Engine shutdown. Pan call. A/c returned.	
200002449	13/04/2000	En route	BRECON (BCN)	20 N	EGTT : London (FIR)	BAE	Turboprop	2	RH engine low oil pressure indication. Engine shutdown. Pan call. A/c returned.	Passing FL170 RH engine oil pressure indication observed to fall from normal to 45 psi - minimum allowable reading. A/c levelled at FL220 for normal cruise and with power reduced indicated oil pressure subsequently fell to 42 psi. Checklist actioned. Engine shutdown. It is understood that following post flight engineering inspection, RH engine oil pressure transducer was changed. Noted that subject a/c had experienced fluctuating RH engine high oil pressure indications one day earlier, which had continued to occur after LH and RH pressure gauges were transposed, and was believed to have been rectified by replacement of subject oil pressure transducer. Failure of pressure transducers has led to a number of instances of significant oil losses and in flight engine shutdowns over the previous years. Investigation into the reliability of oil pressure transducers introduced under SB J41-77-002 in 1997, ongoing under 1999/04977.
200002544	26/03/2000	En route	Whitby (North Yorkshire)		EGTT : London (FIR)	CESSNA	Reciprocating	2	RH engine lost oil pressure. Engine shut down, aircraft returned and landed safely.	On inspection the sump was found to contain about two US quarts of oil, having been full for take off.
200002869	28/04/2000	En route			EGTT : London (FIR)	DE HAVILLAND	Turboprop	2	Nr2 engine oil pressure warning. Indicated pressure fell below 40psi. Engine shut down. Aircraft landed safely.	
200002920	01/05/2000	Approach	Liverpool (Merseyside)		EGTT : London (FIR)	HAWKER SIDDELEY	Turboprop	2	LH engine throttle lever jammed.	During climb out LH engine power spooled down to 11000rpm, 105psi torque, 690deg C TGT with moderate yaw. Oil temperature indication normal. Flight continued as required speed (160kt) sustainable. During approach LH throttle closure yielded no power reduction. Orbit flown to lose height and LH engine shut down. Aircraft landed without further incident. Initial inspection revealed no abnormalities. Engineering investigation found that the throttle lever coupling had separated at the control box on the engine. The coupling is secured with a nut and bolt, the nut being split pinned. Bolt, washer and spacer were found in the engine cowling, the nut was not found. Engine was purchased as a powerplant and fitted by the operator on the 25 April 2000. There is no documentary evidence indicating that any work was carried out in this area since the powerplant was fitted to the a/c. Notice to engineers issued and operator's maintenance procedures to be revised. CAA Closure: The hazard is adequately controlled by the operator's actions.
200003025	27/04/2000	Take-off	GLOUCESTER-STAVERTON (Gloucester)		EGTT : London (FIR)	PIPER	Reciprocating	2	Double engine malfunction. Pan call. A/c returned and landed safely with AFS in attendance.	The aircraft was on the fourth take off of the day when the pilot 'felt' that there was insufficient power from the engines and abandoned the take off. The pre flight checks had been satisfactory and during subsequent engine ground runs by the maint org, both engines achieved maximum RPM and manifold pressure. However, the left engine fuel flow was low and the unmetred fuel pressures were measured and adjusted. Subsequently the left hand fuel pump was changed. CAA Closure: Hazard adequately controlled by operator and maint org actions.
200003071	08/05/2000	En route	Cardiff (CDF)		EGTT : London (FIR)	AIRBUS	Turboprop	2	"Mayday" declared & a/c returned due to RH engine shutdown. Uneventful landing. Compressor blade root failure.	P1 reported pressure problems with RH engine prior to shutdown. Inspection confirmed 4th stage compressor blade failed, pieces of the blade found at rear of engine. As the leasing operator has suffered three such failures that has also affected other A320 operators using the same higher thrust IAE V2527-A5 engine variant, an ultrasonic inspection of all related compressor blades has been carried out in addition to a Variable Stator Vane (VSV) scheduling upgrade (SCN 15T) and VSV health check across the fleet. Engine manufacturer actively involved to ensure problem solved. CAA Closure: Appropriate action taken by operator and engine manufacturer.
200003224	10/05/2000	En route	Birmingham (West Midlands)	10 N	EGTT : London (FIR)	BAE	Turboprop	2	LH engine oil pressure warning on CAP together with decreasing oil pressure indication. Engine shutdown. Mayday call. Diverted and landed safely.	Noted that a/c was operating under an ADD, raised 28 April 2000, relating to erratic LH engine oil pressure indications. Initial engineering investigation is understood to have found no evidence of oil leakage or loss through the jet pipe or intake and the LH engine oil tank contents to be at the maximum level with the propeller feathered. An investigatory engine ground run replicated the fault with a maximum LH engine oil pressure indication of 20psi achieved. Investigation being progressed under 1999/08657.
200003505	23/05/2000	En route	Bristol International (Avon)	25nm N	EGTT : London (FIR)	SHORT	Turboprop	2	RH engine torque fluctuations followed by loss of oil pressure. Engine shutdown. Aircraft returned and landed safely.	
200003771	03/06/2000	En route	Boreham, Essex (Essex)		EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	2	Nr1 engine fire warning. Engine shutdown. Smoke and fumes in cockpit. Forced landing.	AAIB Field investigation. The incident initiated when the Nr1 engine fire warning light illuminated after the helicopter had departed Boreham Airfield. The pilot turned back towards the airfield, shut down the Nr1 engine and fired the first fire extinguisher. However, the fire warning remained illuminated and he therefore fired the second extinguisher but the fire warning remained on and a strong smell of burning became apparent in the cockpit. This was followed by smoke issuing from the right side of the central console and so the pilot conducted a forced landing. After shut down, no evidence of fire was apparent in the engine area. Subsequent inspection by engineers found that the circuit board and four associated current limiting resistors for the Nr1 engine fire push button switches had severely overheated. In addition, they found a broken electrical connection to a terminal block within the engine fire detection system. These findings indicated that a false Nr1 engine fire warning had been initiated by the broken wire connection. When the pilot had discharged the extinguishers into the Nr1 engine bay, the evidence indicated that one of the fire bottle explosive squib filaments had not melted. This intact filament had then allowed DC current to continue to flow through the current limiting resistors, as the current shorted to 'ground' through the filament, causing severe overheating and smoke from the circuit board, which was located on the right side of the central console. Three Safety Recommendations, Nos. 2000-62, -63 and -64, were made to Eurocopter and the DGAC regarding the design and integrity of the engine bay fire detection and extinguishing system and suggested amendments to the associated section of the Flight Manual. See AAIB Bulletin 2/2001, ref: EW/C2000/06/09 and CAA FACTOR F16/2001 Issue 2. CAA Closure: The hazard is adequately controlled by the actions stated above.

200004006	13/06/2000	En route			EGTT : London (FIR)	CANADAIR	Turbofan	2	Anti-icing problem necessitated LH engine shut down. LH 14th stage bleed air duct warning illuminated. A/c diverted.	Upon selection of anti-ice system ON, the crew experienced an overheat warning. Iaw the operating procedures, this warning would require the crew to shut down the engine. Fire services attended as a precaution. See also 2000/08209.The operator has been working closely with the manufacturer and the outcome of the investigations has produced an SB (A601R-36-014), detailing the engineering fix and revised crew operating procedures that do not require the engine to be shut down.□ CAA Closure: The hazard is adequately controlled by existing requirements and procedures.
200004218	16/06/2000	Take-off	London-Heathrow - LHR		EGTT : London (FIR)	BOEING	Turbofan	4	Nr3 engine reverser unstowed light illuminated during initial climb. Nr3 engine shutdown, "Pan" declared, fuel jettisoned and a/c returned.	During climb the No.3 engine thrust reverser unstowed light illuminated. The aircraft was levelled at 6000ft and power reduced following which the light extinguished. Power was increased causing the light to re-illuminate accompanied by vibration felt through the control column. The engine was shut down and the aircraft returned and landed without further incident. Engineering investigation of the technical records revealed a history of intermittent illumination of the light which was attributed to a loose sensor although no reports of vibration had been previously recorded. During ground checks, the reverser, indications and locks operated normally, however as a precaution the sensor was changed. Subsequent operation of the system was normal. The reason for the reported vibration has not specifically been identified. No further action is proposed with respect to this incident. □ CAA Closure: The hazard is adequately controlled by existing requirements and procedures.
200004337	20/06/2000	En route	Stansted (Essex)	8 S	EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	2	Engine chip warning. Engine shutdown. Pan call. Diverted and landed safely.	Investigation being progressed under 200207538.
200004343	19/06/2000	En route	Teddington (Greater London)	2 E	EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	2	Nr1 engine fire warning. Checklist actioned - engine shutdown. Diverted and landed safely.	Fire detector electrical connector wire to crimp found detached. Appropriate rectification action taken.
200004945	07/07/2000	Take-off	East Midlands		EGTT : London (FIR)	SHORT	Turboprop	2	Nr1 engine propeller overspeed.	On climbout with P2 handling, the P1 became aware of Nr 1propeller overspeeding. Checklist actioned and engine shutdown. Emergency declared. Aircraft returned and landed safely with AFS in attendance. Investigations identified indication problems. Tachogenerator and indicator changed.□ CAA Closure: The hazard is adequately controlled by the operator's actions.
200005172	15/07/2000	Take-off	East Midlands (Derbyshire)		EGTT : London (FIR)	LOCKHEED	Turboprop	4	Nr1 engine fire warning during take off roll at approx 90kts. Engine shutdown. Grey smoke emitting from below the turtle deck of jet pipe. Both fire bottles fired. A/c shutdown and evacuated on R/W.	Clamp securing the swirl straightener had failed allowingthe swirl straightener to move aft and hot exhaust gasses to escape into Zone 1, around the jet pipe mouth. A Zone 1 fire warning followed. Clamp, PN Marmon 54309-1, to be despatched to DERA for analysis of failure. Their examination determined that the failure resulted from a fatigue crack originating at a spot weld. It was concluded that the crack had grown rapidly and that, due to its unusual nature, was unlikely to have been observed during routine inspection, only becoming visible shortly before failure. All swirl straightener clamps in the remainder of the fleet wereclosely inspected for signs of cracking but none were found. Considered an isolated incident.□ CAA Closure: Hazardacceptable provided frequency remains low.
200005249	04/07/2000	En route	Bournemouth (English Channel)	15nm S	EGTT : London (FIR)	PIPER	Reciprocating	2	RH engine high oil temperature/low oil pressure. Engine shutdown. Aircraft returned and landed safely.	Oil filter base seal failure.
200005540	29/07/2000	Approach	White Waltham (Berkshire)		EGTT : London (FIR)	DE HAVILLAND	Reciprocating	2	LH engine began to vibrate and was shut down. Aircraft landed safely.	Investigation revealed that the nr6 con rod had become detached at the big end and punctured the crank case.
200005641	19/07/2000	En route	Stapleford (Essex)	2.5 S E	EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	2	LH engine chip detector warning followed by a split in T4- LH engine high. FRCs actioned. Pan call. Engine shutdown. Diverted to Stapleford and landed on grass area beside R/W.	Debris found on rear bearing, gearbox and oil tank magnetic chip detectors in a combination of spall and splinters.Due to the amount of debris oil filter was not inspected.All oil lines not part of the engine and the oil tank flushed and oil cooler replaced prior to replacement engine being fitted. Awaiting engine strip report. See also 2000/00964.
200005756	05/08/2000	En route	Bovingdon (BNN) (Hertfordshire)		EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	2	Nr1 engine oil pressure warning together with torque fluctuations. Engine shutdown.	
200006167	22/08/2000	En route	North Sea (North Sea)		EGTT : London (FIR)	SIKORSKY	Turboshaft	2	Nr1 engine chip light illuminated in the cruise. C/b pulled and reset but caption would not extinguish. Engine shutdown and Pan call transmitted. Single engine running landing completed safely.	Reduction gearbox and accessory gearbox mag plugs contaminated with metal particles. Oil tank mag plug and engine oil filter also contaminated. Engine changed. Awaiting strip report.
200006257	23/08/2000	En route	Cardiff (CDF) (Glamorgan)		EGTT : London (FIR)	SHORT	Turboprop	2	Low power on RH engine. Pan call. Engine shutdown. Aircraft returned and landed safely.	A simulated asymmetric go-around was carried out with lowtorque set on the RH engine (approx 700lbs torque and 1700 PRPM). On advancing the RH power lever to reset normal levels, PRPM reduced to 1400 and torque rose to 1900lbs. Despite advancing throttle nearly fully forward Ng remained at approx 89%. Pan call transmitted, engine shutdown and aircraft returned. Problem recurred on following day - see 2000/06293. Subsequent maintenance investigation tests revealed that there was a problem with the movement of the blades in pitch change which were stiff and jerky. Duringstrip examination it was found that all six C-792 blade retention split bearings races and ball bearings were very badly corroded. It was this corrosion damage which prevented smooth movement of the blades during pitch change operation. A special check of all eight in-service HC-A6A-3A type propeller assys utilising Hartzell Service Instruction 179 to enable a blade travel movement check to establish blade bearing condition. One assy was removed for reported stiff operation. The 'B' Check lubrication period of 450FH or 4 months was amended on 13 Oct 2000 to comply with Hartzell Service Letter 184 for the recommended lubrication process and type of grease to be used. □ CAA Closure: The hazard is adequately controlled by existing requirements and the reporters actions stated above.
200006291	24/08/2000	En route	Spalding (Lincolnshire)		EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	2	Nr2 fuel filter caption illuminated. Engine shutdown, aircraft returned and landed safely.	Fault traced to a defective differential pressure switch,which was changed.
200006293	24/08/2000	Take-off	Cardiff (CDF) (Glamorgan)		EGTT : London (FIR)	SHORT	Turboprop	2	Severe loss of power on one engine. Pan call. Aircraft returned and landed safely.	Recurrence of problem reported on previous day. Investigation being progressed under 2000/06257.
200006729	07/09/2000	En route	ORTAC (English Channel)		EGTT : London (FIR)	BRITTEN NORMAN	Reciprocating	3	LH engine vibration accompanied by smoke and oil mist from associated exhaust. Engine shutdown. Flight continued tooriginal destination and aircraft landed safely.	Defect traced to nr5 cylinder which had virtually separated mid-way up the barrel section. Oil pressure filter checked and found heavily contaminated. Engine removed for strip inspection and strip report concluded that the crackingoriginated from a corrosion pit. A review of the databaseshowed that there have been approximately two events per year on average, since 1976. There were three events in 2000 and one in 2001. In view of this, no further action is planned at this stage, but the situation will be monitored. See also 200001065.□ CAA Closure: The hazard is acceptable provided the frequency remains low.
200006863	14/09/2000	En route	MERLY	Near	EGTT : London (FIR)	BOEING	Turbofan	2	RH engine shut down due oil filter warnings. PAN declared, fuel dumped and the aircraft returned. Oil Filter differential pressure (DP) sensor out of range, replaced.	During climb through FL300, status message "Eng Oil Filter sensor" followed by "Eng Oil Filter R" displayed. RH engine shut down, PAN declared, fuel dumped and the aircraft returned. Oil quantity on stand 20qts. On return to LGW, the oil filter and scavenge screens were inspected, but no contamination was found. Due to the presence of Oil FilterDP sensor out of range maintenance message, the sensor, core harness and FDEC were replaced. The aircraft returned to service with no recurrence. Subsequent investigation concluded that the most probable cause was the failure of the W739 harness as it had significant internal chafing. Maintenance Programme has been revised to include a Ramp 1 inspection item (G79020BA) to monitor the Oil Filter DP maintenance message on a daily basis. The task requires the immediate rectification of the fault on one engine if both have the message, and 5 days to rectify if fault is on one engine. An improved harness is being developed to prevent chafing, and thermal insulation blankets are also being developed to improved reliability of the sensor.□ CAA Closure: The hazard is adequately controlled by existing requirements, procedures and documentation.
200006870	13/09/2000	En route	Leeds Bradford (LBA) (West Yor	5 S	EGTT : London (FIR)	BOLKOW	Turboshaft	2	Engine chip warning. Engine shutdown. Pan call. Diverted and landed safely.	See also 2000/03229.
200006911	12/09/2000	En route	Nympsfield (Gloucestershire)		EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	2	LH engine caption illuminated. Engine shutdown, aircraft diverted and landed safely.	Investigation revealed substantial oil leak from nr1 engine but exact source not determined. Unable to turn compressor by hand. Engine removed and despatched for further investigation. During the subsequent engine strip, the cause of the shutdown was identified to be the failure of the number one bearing. In-service In Flight Shut Down (IFSD) data indicates low frequency of engine failures due to the number one bearing.□ CAA Closure: The hazard is acceptable provided the frequency remains low.

200007014	18/09/2000	En route	Manchester (MCT) (Greater Manc		EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	2	RH engine chip caption illuminated in flight. Pan declared. Engine shutdown. Aircraft diverted and landed safely.	Both magnetic plugs removed and checked for debris - nonefound. Plugs refitted and ground run carried out satis.
200007503	06/10/2000	En route	Newbury (Berkshire)		EGTT : London (FIR)	SIKORSKY	Turboshaft	2	Degraded/minor DECU fault on nr2 engine together with a 20% split in torque and followed by oil pressure falling below 18 psi. Engine shutdown. A/c returned.	Rag ingested into nr2 engine - rag had been left in the engine plenum chamber during check 'A' carried out by P2 prior to flight.
200007621	13/10/2000	En route			EGTT : London (FIR)	CANADAIR	Turbofan	2	A/c diverted due engine problem. Engine shut down, a/c subsequently leaked fuel onto diversion runway.	
200007626	14/10/2000	En route	Luton (LUT)		EGTT : London (FIR)	BOEING	Turbofan	2	LH engine shut down due low oil quantity and pressure. "Pan" declared. Radial drive shaft bearing failure.	At 3000ft on base leg, EICAS indicated rapidly decreasingLH engine oil quantity followed by reducing oil pressure.QRH drills actioned and LH engine shut down before oil pressure fell to zero. "Pan" declared and uneventful flap 20landing carried out. Following fire service inspection, aircraft taxyed to stand. Incident was the result of a pre-SB72-C925 radial drive shaft bearing failure. The operator is now complying with SB72-DO88 and is to embody SB72-D088-D176 across the fleet when engines next undergo an engine shop visit.□ CAA Closure: Appropriate action taken by operator.
200007774	16/10/2000	Approach	Bristol International (Avon)		EGTT : London (FIR)	PIPER	Reciprocating	2	Unsafe LH MLG indication. Flypast inspection carried out - landing gear appeared to be down and locked. Aircraft landed safely with LH engine shut down.	
200007787	17/10/2000	Take-off	Stansted		EGTT : London (FIR)	BOEING	Turbofan	2	Birdstrike to nr2 engine climbing through 500ft. Engine shutdown and a/c returned.	
200007877	20/10/2000	En route	Coventry (West Midlands)		EGTT : London (FIR)	SHORT	Turboprop	2	RH engine failure. Emergency declared. Landed safely.	Failure due to defective FCU/fuel pump with high levels of contamination in fuel filter. Fuel system, oil filters and chip detectors checked and found satis. FCU and fuel pump changed and ground run and rigging checks completed satis. Strip inspection carried out on defective items but this proved inadequate in determining the cause of failure. Operator reminded of responsibilities to make a full assessment of such events in order to identify root cause of failures. Operator has subsequently revised component management procedures in the MME to require detailed strip reports in future.□ CAA Closure: The hazard is controlled by the actions stated above.
200007918	25/10/2000	En route	Blackpool (BPL) (Irish Sea)	15nm W	EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	2	Nr2 engine chip warning illuminated. Engine shut down iawemergency checklist. Flight continued on single engine for running landing.	Sliver of metal found on chip detectors associated with module 5 scavenge line. Attributed to build debris as module 5 had been installed 13 hours earlier.
200008004	29/10/2000	En route	Southampton (SAM) (Hampshire)		EGTT : London (FIR)	FOKKER	Turboprop	2	Nr1 engine fire warning. Engine shut down. Pan call. Aircraft diverted to Gatwick and landed safely.	No immediate evidence of fire on post flight inspection.Initial investigation revealed a fire detection system defect. Following routine trouble-shooting the defect was traced to a missing grommet from a fire wire "P" clip which caused a low resistance condition. The fire wire and grommets were replaced following which satisfactory test valueswere recorded. The records showed that the aircraft had recently undergone a base maintenance input (20 flying hours previous) during which a specific task to inspect and test the engine fire detection system was carried out. The maintenance organisation responsible for carrying out the inspection was contacted and advised of the findings. An internal investigation was carried out and the incident discussed with the personnel directly involved with the inspection. The maintenance personnel indicated that they were satisfied with the condition of the system at the time of inspection, however it was noted that the task card did notspecifically request that the resistance values be recorded. The recommendation has been made that the task card beamended to facilitate recording of measured values. No further action is proposed.□ CAA Closure: The hazard is adequately controlled by the reporters actions stated above.
200008021	26/10/2000	Take-off	London-Heathrow - LHR		EGTT : London (FIR)	BOEING	Turbofan	4	Birdstrike to nr3 engine climbing through 150ft. Engine vibration limit exceeded. Nr3 engine shut down, fuel jettisoned and a/c returned.	Nr3 engine fan blades damaged, possibility of another strike to nr2 engine. Bird recovered from runway. Subsequent borescope inspection of nr3 engine found no damage to engine core. All N1 fan blades changed.
200008253	06/11/2000	En route			EGTT : London (FIR)	BAE	Turbofan	4	Nr1 engine "ENG OVSPD" warning illuminated. Engine shutdown, "Pan" declared and a/c diverted. Secondary overspeed controller failed.	See also 2000/08624 and 2000/08802.
200008386	10/11/2000	En route			EGTT : London (FIR)	BOEING	Turbofan	2	Unable to control LH engine EPR during cruise. Engine shut down, "Pan" declared for expeditious approach. P1 probe pipe sheared.	Autothrottle disconnected, LH engine developed 1.3EPR with thrust lever held closed. RH engine operation normal. LHEngine shutdown, "Pan" declared and an uneventful landingwas completed. Investigation found P1 probe pipe sheared off at P1 probe connection. The pipe failed at the end fitting attachment to the main pipe which is a welded joint. This failure mode has been seen previously and it also showed signs of polishing at one of the support clips. As a result of these findings on the nose cone assembly, Aircraft Maintenance Programme (AMP) proposal 15709 is being raised to inspect the P1 pipe and clipping at Inter Check on the 535C powered aircraft.□ CAA Closure: The hazard is adequately controlled by the operator's actions.
200008502	11/11/2000	En route	Manchester (MCT) (Greater Manc	30nm N	EGTT : London (FIR)	PIPER	Reciprocating	2	Pilot reported LH engine shut down (reason unspecified). Aircraft landed safely.	
200008669	21/11/2000	En route	North Sea (North Sea)		EGTT : London (FIR)	SIKORSKY	Turboshaft	2	Nr2 engine chip ight illuminated and remained on after c/b was reset. Engine shut down and aircraft diverted to Humberside.	Investigation revealed that the 3 dimensional chip found to be bridging MPI II mag plug (Turbine Rear Bearing oil sampling). Engine removed for Mo3 replacement i.a.w. MM requirements. Reporter expressed concern about general fleet serviceability of this version of Arriel engine within their fleet and why these engines were not reaching their TBO.
200008732	24/11/2000	En route	Exeter (Devon)		EGTT : London (FIR)	FOKKER	Turboprop	2	A/c returning due to RH engine propeller imbalance/vibration. Engine shutdown. Emergency declared. Landed safely.	
200008749	23/11/2000	En route	Hengistbury Head (Dorset)		EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	2	Following red 'REG' warning and kick in yaw, nr1 engine gauges went to max. Manual selected but nr1 engine could not be controlled with SSL. Engine shut down and aircraft diverted.	Smell of burning evident during approach. Investigation revealed signs of high temperature towards rear of engine, causing damage to top engine cowling and door, discolouration of turbine casing and leaving sooty deposits on cowlings, rear of engine and adjacent airframe. Free turbine found seized, gas producer able to rotate. Engine despatched to manufacturer for further investigation which found thatthe Delta P constant valve diaphragm was incorrectly installed.This resulted in the puncture of the diaphragm. OEM Quality Review undertaken as a result.□ CAA Closure: The hazard is controlled by the actions stated above.
200008802	27/11/2000	En route	Detling (DET)	40nm	EGTT : London (FIR)	BAE	Turbofan	4	Nr1 engine overspeed (auto) shut down. A/c returned. Overspeed controller failed.	Engine overspeed auto shut down of nr1 engine occurred during climb through FL120. QRH drills carried out and a/c returned. Overspeed controller changed, system tested satisfactory. Supplementary to the event, it was later realised the engineer who changed the controller had gone beyond the limits of his authority. Engineer interviewed by operator. See also 1999/02753, 2000/08253, 2000/08588 and 2000/08624.□ CAA Closure: Appropriate action taken by operator.
200009031	08/12/2000	En route	Stansted (Essex)		EGTT : London (FIR)	EMBRAER	Turboprop	2	Loud bang accompanied by flames from nr1 exhaust. LH engine shutdown and flames ceased. Pan call. Diverted and landed safely. LH propeller found seized.	Engine found to have suffered turbine failure. Although severe blade damage, all debris contained. Whilst the manufacturer is reviewing the failure rates and potential for possibility of non-contained debris from similar failures, the global IFSD rate allows this report to be closed as anisolated event. □ CAA Closure: The hazard is acceptable provided the frequency remains low.
200009069	09/12/2000	En route	Dover (DVR) (Kent)		EGTT : London (FIR)	DORNIER	Turboprop	2	Engine shutdown. Diverted to Southend.	
200009102	08/12/2000	En route	Biggin (BIG) (Kent)		EGTT : London (FIR)	SAAB	Turboprop	2	Engine fire warning. Engine shut down. Aircraft diverted and landed safely.	

200009104	13/12/2000	En route	Lands End (LND)		EGTT : London (FIR)	BOEING	Turbofan	4	Nr4 engine vibration indicated 2.7 units, with associatedwarning, following climb power selection at FL290. PAN declared, engine shutdown, 60,000kgs fuel jettisoned and aircraft returned.	Uneventful three engine landing. Defect troubleshooting carried out, no defects found. Fan blades removed, cleaned,and specified lubrication carried out. Engine run vibration survey carried out and engine returned to service. No further reports. The operator decreased the fan blade lubrication frequency to eliminate this type of occurrence.☐ CAA Closure: The hazard is acceptable provided the frequencyremains low.
200009282	13/12/2000	En route	Redhill (Surrey)		EGTT : London (FIR)	AGUSTA	Turboshaft	2	Nr2 engine low oil pressure warning. Engine shut down. Aircraft returned and made run on landing with AFS in attendance.	Fault traced to leak from nr6 and 7 external oil sump gasket. Leak was not apparent during ground run. Engine did not run dry and suffered no damage. Gasket changed, oil replenished and engine tested satis. Considered an isolated occurrence.☐ CAA Closure: The hazard is acceptable providedthe frequency remains low.
200009412	27/12/2000	En route	Harrow (Greater London)		EGTT : London (FIR)	MD HELICOPTER	Turboshaft	2	Nr1 engine flamed out due to fuel starvation. MAYDAY declared. Flight continued to base for uneventful single engine landing. Fault caused by contamination of the venturi of the jet pump.	In the cruise at 1500ft, a double bang was heard accompanied by a nr1 engine low RPM indication. Everything then returned to normal for 20-30 seconds until speed was reduced, at which point the nr1 engine ran down and stopped. Fuel quantity was showing in excess of 150lb. The engine shutdown drill was carried out and a MAYDAY declared. The flight continued to base where the aircraft completed an uneventful single engine landing. Investigation concluded that the nr1 engine had stopped in flight due to fuel starvationas the RH cell of the fuel tank was empty, probably as a result of a discrepancy in 'Jet Transfer' pump efficiency.The fuel quantity was correctly displayed as being in excess of 150lb, however the 'low fuel' tick marks on the IIDS display were not seen. The reporter comments that these tick marks are difficult to see, that there is no associated 'Master' warning or other alerting caption and that theFlight Manual is not clear as to the exact information conveyed by the tick marks. As a result of this incident theoperator has issued a Flight Safety Instruction stating that: refuelling must be in excess of 450lb; minimum planned landing fuel should be increased from 150lb to 300lb; any 'low fuel' tick mark should be treated as a 'land immediate' emergency and fuel probe failures require a return to maintenance base. Following this incident the fuel tank was inspected and particles were found blocking the venturi of the jet pump - pump changed and fuel tank cleaned. Reporter cites that during standard fuel check on the 24 March 2001 particles, which appeared similar to those blockingthe venturi of the jet pump, were found in the fuel sample. Reporter also cites a further similar occurrence on the4 April 2001 when after landing following low fuel tick marks on the IIDS display, the nr1 engine flamed out duringground run. Fuel contamination found - sample sent for analysis. The aircraft manufacturers have issued Mandatory SB900-080 15 May 2001relating to fuel contamination inspection, revised pages from RFM against low fuel warnings, revised MM pages for fuel contamination and checks on low fuel warning system, an also improved build procedures to eliminate 'factory' contamination.☐ CAA Closure: The hazard is adequately controlled by the actions stated above.
200009433	22/12/2000	En route	English Channel (English Chann		EGTT : London (FIR)	BRITTEN NORMAN	Reciprocating	3	Rear engine overheat warning accompanied by high CHT indication. Engine shutdown. Aircraft returned and landed safely.	Overheat warning extinguished approx five minutes after engine shutdown. Visual inspection revealed no evidence of overheat or fire. During subsequent ground run nr2 CHT gauge fluctuated severely - CHT probe harness changed and further ground run carried out with satisfactory results. Aircraft returned to service but similar problem occurred twodays later. Investigation being progressed under 2000/09434.
200009494	31/12/2000	En route	Claughton (Lancashire)		EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	2	LH engine chip caution illuminated. Engine shut down and flight continued without incident. Engine restarted for landing which was uneventful.	
200100035	05/01/2001	En route	Liverpool (Irish Sea)	5nm W	EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	2	Nr1 engine chip light illuminated. Engine shut down. Aircraft returned and landed safely.	Fault traced to a dirty/deteriorating insulator inside engine harness connector PN 9550113490. Considered a random event, harness to be replaced at next workshop visit.
200100171	12/01/2001	En route			EGTT : London (FIR)	FOKKER	Turboprop	2	RH gearbox oil pressure warning. RH engine shutdown in-flight.	Flight continued to intended destination and aircraft landed safely with AFS in attendance. Investigation found that the nr2 gearbox had lost all oil contents. The oil filter connection at the top of the cabin blower was loose and the oil appeared to be leaking from this point. Further inspection showed that the threads in the cabin blower connection that mates with the oil filter were stripped. The oil filter had last been inspected (iaw the relevant AMM procedure) approx five weeks earlier but the internal thread of the filter attachment housing had not been inspected as there were no visible signs of damage to the thread of the filter assembly. No difficulty was experienced in refitting the filter and no leaks or any other defects were apparent during the subsequent ground runs. The incident is to be highlighted to engineering staff with a reminder of the need for extra vigilance when refitting the blower filter to ensure no damage has occurred to the filter housing thread.
200100255	15/01/2001	En route			EGTT : London (FIR)	BOEING	Turbofan	2	LH engine oil pressure warning. Oil pressure reduced from 17 to 3psl and contents indicated zero. LH engine shutdown, "Pan" declared and a/c returned. Radial drive bearing failure.	The RB211-535 engine has suffered a number of radial drive steady bearing failures at low life. A number of failure causes have been identified as follows : Low life lapping failures, loose rivet failures, 'O' ring leakage and fatigue failures. A mandatory NMSB72-C810 was issued in May 1999 requiring repetitive magnetic chip detector (MCD) inspections and no engines to have both engines fitted with lowlife bearings. The low life lapping failures were attributed to five batches of bearings manufactured from July to December 1998. Mandatory NMSB72-C930 issued to remove suspect bearing from service. The random fatigue failures have been minimised by the introduction of assembly balancing(SB72-9359) at the build of the module. A solid inner shaft (SB72-B141) has also been introduced which reduces the dynamic effects at high speed. Loose cage rivets have been responsible for a number of bearing failures and as such improved manufacturing processes have been introduced. Mandatory NMSB72-D176 (REPLACING 72-C810) issued to address the multi engine risk from loose cage rivets. NMSB72-D088 issued to address MCD inspection intervals. A new radial drive bearing has also been introduced (SB72-C925) which terminates all of the above inspection requirements. Operator to introduce a new standard of bearing into the fleet.☐ CAA Closure: Appropriate action taken by operator and aircraft manufacturer.
200100405	23/01/2001	En route	Chivenor	20nm WSW	EGTT : London (FIR)	BAE	Turbofan	4	Double engine inflight shut down due nr3 engine oil loss and nr2 engine fire warning.	Whilst on test flight following maintenance, nr3 engine oil quantity decreased at an abnormally high rate during climb to FL310. Following certain engine checks, oil quantity dropped towards empty and a film of oil was evident on RH cabin windows, although no low pressure indication was displayed. Nr3 engine was shut down as a precaution and airstest terminated. At commencement of descent, nr2 engine fire warning activated and engine was shut down iaw emergency abnormal checklist - warning extinguished when fire "T" handle was pulled, although nr1 shot was fired as a precaution. Nr3 engine was relit on base leg (due lack of hydraulic EDP) and kept at flight idle during 24deg flap landing. Investigation of the nr3 engine problem identified a leak from the hydraulic shaft seal drain, and an engine gearbox seal associated with the hydraulic pump and pump shaft seal were replaced. Concerning the nr2 engine, no faults to the fire detection system wiring could be found, but as a precaution, the fire detection loop B was replaced. No further defects reported.☐ CAA Closure: The hazard is adequately controlled by existing requirements, procedures and documentation.
200100410	20/01/2001	Approach	GLOUCESTER-STAVERTON (Gloucester)		EGTT : London (FIR)	MD HELICOPTER	Turboshaft	2	Nr2 engine low oil pressure warning. Engine shut down. Pan declared. Aircraft returned and made single engine running landing.	Oil appeared to be leaking from filler cap but cap appeared to be secure and when inspected was found serviceable. Oil level reinstated and cap secured. Ground run/leak check completed with satisfactory results.
200100520	23/01/2001	Take-off	East Midlands		EGTT : London (FIR)	EMBRAER	Turbofan	2	"TAT 1 HEAT FAIL" caution followed by "ENG1 CTL A & B FAIL" and "ENG2 CTL A & B FAIL" when landing gear retracted after take-off. A/c returned.	Nrs 1 and 2 engine control A and B reset iaw QRH, although decision made to return because "TAT1 HEAT FAIL" is not permitted for flight into known or forecast icing conditions. Reporter confirms that "TAT1 HEAT FAIL" message is cancelled on landing by Weight On Wheels (WOW) switch, but is concerned that, because this system is inhibited, it is not possible to ascertain that there is a failure until a/c is airborne. Investigation iaw AMM resulting in TAT probeNo1 replacement, aircraft realised to service - no further problems reported. Considered an isolated case.☐ CAA Closure: The hazard is acceptable provided the frequency remains low.
200100560	30/01/2001	Take-off	Liverpool		EGTT : London (FIR)	BOEING	Turbofan	2	Birdstrike during rotation. "Mayday" declared. Diversion.Nr2 engine shut down due bird ingestion - fan casing damaged.	Loud rumbling noise heard during landing gear retraction,therefore, "Mayday" declared due to unknown damage and diversion to Manchester requested. Nr2 engine vibration meter indicated above 5 units, nr2 air valve open light illuminated, flashes of light observed outside a/c from RH flight deck window and smell of electrical burning evident. Nr2engine shut down and uneventful landing carried out. Initial post flight inspection revealed considerable damage to fan casing with bird remains and blood stains evident at rear of engine. The bird situation at Liverpool is being audited as part of the ASD programme.☐ CAA Closure: The hazard is adequately controlled by existing requirements.
200100570	25/01/2001	En route	Welshpool (Powys)	5 N W	EGTT : London (FIR)	BELL	Turboshaft	2	Nr2 engine oil pressure warning - pressure fell to 0 psi.Engine shutdown. Landed safely.	Post flight inspection found severe oil leak covering tailboom and combining gearbox - no oil visible on nr2 enginesight gauge. Oil cooler matrix cracked. Subject to daily monitoring for 25hrs. Filter and chip detectors inspected,no debris apparent. Cooler assembly changed, system drained and replenished, ground run and leak check carried out satisfactory. A/c released for return to base. On return significant non ferrous debris found in oil filter - debrisconfirmed as machining debris from repair. Replacement oil cooler system drained, oil lines flushed and cooler replaced with item from another a/c. Engine ground run carriedout, filter/chip detectors inspected satisfactory. A/c returned to service subject to daily monitoring.
200100619	31/01/2001	En route	Exeter (Devon)	10 S	EGTT : London (FIR)	BOLKOW	Turboshaft	2	Nr1 engine chip warning. Engine shutdown. Pan call. A/c returned and landed safely.	Accessory gearbox mag plug contaminated with paste. Oil system drained/replenished. Ground run carried out satisfactory. Turbine and compressor modules changed 20.25hrs previously and 150hr engine inspection carried out 2.35hrs previously.

200100651	04/02/2001	En route	London-Gatwick - LGW		EGTT : London (FIR)	BOEING	Turbofan	2	PAN declared and a/c returned due nr2 engine indication fault. Both overheat detector elements failed.	A/c returned without incident with nr2 engine selected toidle. Overheat detectors on nr2 engine disconnected and EIR checks carried out on each detector. All measurements found to be satisfactory. Loops A and B between 5.95 and 5.99 K Ohms. Due to previous report of a loop A core detector connector being contaminated, connector D3088 and enginecore overheat detector replaced. For evaluation purposes,all detectors reconnected and system checked law MM 26-11-00. It has been confirmed by strip report that both elements failed due to the alarm point temperature being low (driftdown). These elements are being replaced on attrition basis. Modification EOC-737-26G056 was raised to replace detectors that are susceptible to "driftdown". CAA Closure: The hazard is adequately controlled by the reporter's actions.
200100801	07/02/2001	En route	Wakefield (West Yorkshire)		EGTT : London (FIR)	MD HELICOPTER	Turboshaft	2	Nr2 engine low oil pressure warning shortly after take off. Pressure continued to fall. Engine shutdown. A/c returned and landed safely.	See also 2001/00410. Another similar occurrence occurredon this aircraft/engine 11 flight hours after this one. No obvious defects were found and as this was the third occurrence, the oil filler cap and filler neck assembly werereplaced and the removed items returned to the manufacturers for investigation. It transpires that this is a knownproblem and has since been the subject of a Service Bulletin (SB) (P&WC S.B. No. 28189R1 dated 02 Mar 2001). The manufacturers are currently developing a modification to the oil system to introduce a non-return valve in the filler neck to prevent loss of engine oil in the event of the cap becoming detached. This is due to be issued in mid 2001. In the meantime the operator has issued a series of Flight Safety Bulletins to aircrews and engineers to ensure they are all aware of the problem. CAA Closure: The hazard is controlled by the actions stated above.
200101182	23/02/2001	En route	Isle of Man (IOM) (Isle of Man)	Nr	EGTT : London (FIR)	HAWKER SIDDELEY	Turboprop	2	Uncommanded RH engine autofeather in descent at approx 5000ft. Engine shutdown. Pan call. Landed safely.	See also 1999/08528, 2000/00687 and 2000/00773. On investigation it was found that the anti-icing system on the RH engine air intake cowling was ineffective when selected toSLOW cycle but operated to requirements in the FAST cyclemode. It is suspected that ice accumulated on the air intake cowling while slow cycle was selected and became detached when fast cycle was selected. This resulted in ice entering the engine intake, causing the engine to flameout. The engine relight system was switched off at the time of the incident. A serviceable engine intake cowling was fitted and the aircraft returned to service with no recurrence reported. The operator has now amended their operating procedures such that when selecting between 'FAST' and 'SLOW'or V.V, switch both ignition systems ON. Secondly, selectone engine at a time, allowing 1 minute between selections. Finally, if no icing present, switch both ignition systems off after a further 1 minute. CAA Closure: The hazardsis controlled by the actions stated above.
200101298	26/02/2001	En route	North Sea (North Sea)		EGTT : London (FIR)	SIKORSKY	Turboshaft	2	Loss of nr2 engine oil pressure. Diverted. Nr2 engine beeped to minimum and later shutdown as precaution.	
200101310	17/02/2001	En route	Southend (SND) (Essex)		EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	2	LH engine chip warning. Engine shutdown. Pan call. Diverted and landed safely.	Lower chip detector found contaminated with small ferrousparticle. Detector cleaned and ground run carried out satisfactory. Warning recurred 5 days later (22 February 2001). Engineering investigation found wire to spot detector required re-crimping and changed attaching nut as a precaution. System tested satisfactory. Investigation being progressed under 200207538.
200101497	03/03/2001	En route	LEEDS BRADFORD (LBA) (West Yar	10nm SE	EGTT : London (FIR)	BOLKOW	Turboshaft	2	Pan declared due to failure of one engine. Aircraft returned and landed safely.	
200101510	09/03/2001	En route	MARGO		EGTT : London (FIR)	FOKKER	Turboprop	2	LH engine failure. Mayday call. Diverted and landed safely.	In the cruise at FL180 the LH engine autofeathered without warning. All engine parameters were normal - feather drill actioned and relight attempted without success. Engine feathered. Mayday call transmitted, aircraft diverted and landed safely. Reporter notes that approx 10 minutes prior to event aircraft had encountered light airframe icing atFL160. Igniters had been operating for 5 minutes until aircraft climbed into clear air and icing began to dissipate. Subsequent investigation and action included changing low torque switch, the igniter plugs and function check of the Power Unit De-icer system. Aircraft has since operatedwithout any further problems. However, strip report into the replaced components did not reveal anything to confirmspecific cause of the defect. CAA Closure: The hazardsis acceptable provided the frequency remains low.
200101714	12/03/2001	En route	Oxford (Oxfordshire)	10 NW	EGTT : London (FIR)	PIPER	Reciprocating	2	Muffled 'thump' from RH engine followed by complete loss of oil pressure. Engine shutdown. Pan call. A/c returned and landed safely.	Investigation found LH half of crankcase, by the side of the manifold valve and above the nr2 cylinder, holed due to crankshaft counterweight assembly failure. Engine (on life extension) beyond economic repair - scrapped.
200102128	02/04/2001	Approach	Shoreham (West Sussex)		EGTT : London (FIR)	PIPER	Reciprocating	2	UK Reportable Accident : Double engine failure due to fuel starvation. Forced landing attempted but aircraft struckhouse and was destroyed. Minor injury to 1 POB. AAIB Field investigation.	The pilot planned a return flight from Shoreham to Sheffield City Airport. The wind was generally south to south westerly at 20 to 35kt with the stronger winds to the north.To avoid the requirement to uplift fuel at Sheffield, thepilot planned to carry sufficient fuel for the return flight, giving a total fuel on board of 60 US gallons (USG). The flight to Sheffield was uneventful with an airborne time of 1 hour 2 minutes. On returning to Shoreham the aircraft was cleared for an overhead join at 2000ft. As the aircraft passed through the overhead, the pilot began a shallow left turn and started to carry out the pre-landing checks during which he advanced the propeller control levers toward the FULLY FINE position. Immediately the aircraft yawed and rolled rapidly to the left. Shortly thereafter thepilot placed both propeller control levers back in the FULLY FINE position and almost immediately the left engine failed completely. The pilot attempted to restart the left engine but nothing happened and, during the course of the restart attempt, the right engine also failed. The pilot informed ATC of the total loss of power and was cleared to land on grass Runway 25. By this stage the aircraft had descended to about 900ft with both propellers windmilling and the landing gear and flap retracted. At about 400ft and pointing directly at the airfield, the pilot realised thathe would be unable to glide to the runway. Noticing a narrow strip of grass between a railway line and the end of several rows of houses, the pilot aimed for this area and lowered the landing gear. As he approached the grass area the pilot flared the aircraft but the left wing struck the roof of a house and the right wing and tailplane struck anadjacent tree. The roof collapsed absorbing much of the aircraft's forward speed and it yawed left and slid into the rear garden of the house largely intact. The pilot suffered head injuries but was able to exit the aircraft unassisted. The fuel on board prior to departure from Shoreham was at least 54 USG. The actual fuel burned during the flight was approx 55 USG. It seems likely that the fuel remaining on board when the aircraft arrived overhead Shoreham was very low with perhaps slightly more in the right tank than the left. The investigation of this accident revealed significant discrepancies in the recording of fuel states for some of the previous fourteen flights. It was recommended that the CAA should ensure that operators of twin engine light aircraft (all types similar to the PA34) in the Transport Category (Passenger) have an effective back up procedure, in addition to the aircraft fuel gauges, by whichthe fuel remaining in tanks after flight may be established and recorded (Recommendation 2001-67). See AAIB Bulletin 9/2001, ref: EW/C2001/4/1. CAA Closure: CAA FACTOR F41/2001, detailing the CAA's response to the AAIB Safety Recommendation, was issued on 15 November 2001. Any further CAA action required will be progressed via the 'Annual Review of AAIB Recommendations' procedure.
200102502	18/04/2001	En route	Southampton (SAM)	5nm S	EGTT : London (FIR)	BAE	Turbofan	4	Nr3 engine shut down. "Pan" declared. A/c returned.	
200102582	18/04/2001	En route	Southampton (SAM)	10nm S	EGTT : London (FIR)	BAE	Turbofan	4	Nr3 engine vibration warning followed by smoke inside a/c. PAN declared. Diversion.	At top of climb, the Master Warning System (MWS) displayed a vibration warning on engine nr3. The vibration indication ranged from 0.6 to top of scale, but all the other engine indications were normal and stable with no corresponding vibration felt through the airframe or throttle levers.The cabin staff then reported thick smoke in the cabin, which then became apparent to the flight crew on the flightdeck. Oxygen masks were donned; the nr3 engine was shut down and an emergency descent made back in to Gatwick. The smoke then started to dissipate and so the crew elected toremove their oxygen masks, as these had made communications difficult. The aircraft landed safely at Gatwick. Therewere no reports of anyone on-board having suffered any ill effects. The nr3 engine vibration and smoke was subsequently traced to a failed nr8 bearing. CAA Closure: Investigation progressed under 200008340 - see AAIB AAR 1/2004.
200102836	24/04/2001	En route	Pershore (Hereford and Worcest	3nm W	EGTT : London (FIR)	JODEL	Reciprocating	1	Spinner bracket failed.	In the cruise at 3000ft, a loud bang was heard followed by severe vibration. The pilot shut down the engine and made a glide approach for a successful forced landing at the nearest airfield. Inspection of the aircraft showed that the spinner and about 9 inches of one propeller blade were missing. Investigation revealed that the spinner attachment bracket had failed at the two points where it is held bythe propeller bolts. On examination, the bolts had faileddue to fatigue at the bends near each of the propeller mounting bolts and fell off the aircraft complete with spinner. The old propeller was removed and replaced with a new unit. Appropriate follow-up action taken by the PFA. CAA Closure: The hazard is controlled by the actions stated above.
200102963	05/05/2001	En route	London-Gatwick - LGW		EGTT : London (FIR)	BOEING	Turbofan	4	Nr3 engine shut down due oil pressure warning. Fuel jettisoned and a/c returned.	Nr3 engine oil pressure warning illuminated and contents indicated zero. A/c levelled at 3500ft, nr3 engine shut down as a precaution. A/c climbed to FL80 and jettisoned 63Tfuel before returning. Investigation found nr3 engine oiltank filter cap dislodged. Nr3 engine oil replenished, MCD and oil filter checked and confirmed normal. Subsequent engine ground runs satisfactory. Certifying engineer interviewed.
200103039	11/05/2001	En route	Morecambe Bay (Irish Sea)		EGTT : London (FIR)	PIPER	Reciprocating	2	UK Reportable Accident : Both engines lost power and wereshut down. Aircraft ditched in sea and sank. No injury to1 POB. AAIB AARF investigation.	The aircraft had not flown for nearly four years. Following extensive engineering work, including replacement of the LH engine nr3 cylinder, it was cleared for one flight only to a maintenance organisation in Blackpool, where the Cof A renewal was to take place. The pilot conducted a full pre-flight inspection and extensive power checks before achieving a normal take off. The aircraft was then flown to a position near the coast for checks on its handling qualities, systems and engines. Satisfied that the aircraft was performing normally, the pilot set course for Blackpoolat an altitude of 2000ft. The flight progressed normally until the aircraft was approx 12nm west of Blackpool. At this point the left engine began to gradually lose power. The necessary checks were completed but power could not be restored so the pilot decided to feather the left propeller and shutdown the engine. The pilot advised the Blackpoolradar controller that he had a problem with his left engine but did not wish to declare an emergency, as he was able to maintain altitude. Three minutes later the pilot declared an emergency as the right engine was now losing power. Checklist actions and systems analysis again failed to restore power. Committed to a ditching, the pilot carried out all the necessary checks, paying particular attention to survival equipment and emergency exits. During the descent he donned his lifejacket and placed a second jacket on the seat beside him. The radar controller initiated emergency action and informed the Warton radar controller of thesituation. Seconds before making contact with the sea thepilot unlatched the cabin door/emergency exit and again confirmed that both engines were secure and propellers feathered. He reported that impact with the sea was 'remarkably light with the aircraft settling slightly nose down in the water with the fuselage and wings intact and above the surface'. The pilot exited the aircraft, inflated both lifejackets and walked along the wing. The aircraft remained afloat for 3 to 4 minutes at which time the pilot entered the water and was clear of the aircraft before it finally submerged. The pilot was located by helicopter and, 15 minutes after entering the water, was rescued unharmed by a fast rescue craft from a rig standby vessel. Further investigation as to the cause of the total power loss could not be carried out, as the wreckage was not recovered from thesea. See AAIB Bulletin 1/2002, ref: EW/G2001/05/14. CAA Closure: No further CAA action.

200103055	08/05/2001	En route	Oxford (Oxfordshire)	5nm NW	EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	2	RH engine chip warning. Engine shutdown. Pan Call. Landed safely.	Pan subsequently cancelled. Pilot reports second chip warning that day. Detector found contaminated with small particle on one chip plug - particle was within manufacturers limits so aircraft returned to service. Plugs and filters rechecked after 5 hours and found clean. Aircraft again released for service.
200103296	15/05/2001	En route	Henstridge (Somerset)	Nr	EGTT : London (FIR)	AGUSTA	Turboshaft	2	Torque split (20-25%), nr2 engine low. Nr2 engine TurbineOutlet Temperature (TOT) high and erratic. Engine shutdown. A/c returned.	Engine trim used to rematch torque and cautious collective 'Sweep' performed. Nr2 engine TOT transiently exceeded 900deg C. FOD found on nr2 compressor.
200103298	15/05/2001	En route	Lands End (LND)	10nm E	EGTT : London (FIR)	BOEING	Turbofan	2	Nr2 engine failed to windmill relight during air test. Air test failed.	A windmill relight of nr2 engine was attempted at 290kts and FL290 iaw CAA air test schedule. There was no EGT rise within 30 seconds stipulated in QRH, therefore, relight attempt abandoned. Second relight attempted about 20 minutes later and EGT rose after 12 seconds and peaked at 502degC. Engine parameters stabilised after 1 minute 15 seconds with all indications well within normal limits. Engine was left at idle for 5 minutes iaw flight test schedule, but when power increase was attempted there was no throttle response. Throttle was exercised over full range but no parameters changed. Engine was then shut down and a subsequent cross bleed start was satisfactory - engine then operated normally. The Fuel Flow Governor (FFG) and HP fuel pump were replaced as part of the investigation. At this time an ignition igniter plug immersion depth check was carried out. The plug installations were found to have insufficient immersion depth and were adjusted accordingly. The engine subsequently had a successful start at altitude and satisfied the air test requirement. □ CAA Closure: The hazards adequately controlled by the actions stated above.
200103560	30/05/2001	Approach	Cambridge (Cambridgeshire)		EGTT : London (FIR)	PIPER	Reciprocating	2	Loss of power in one engine. Pan call later upgraded to Mayday as second engine began to lose power and pilot was unable to maintain height.	Both engines subsequently recovered, Mayday cancelled and aircraft landed safely. See also 2001/03039.
200103593	30/05/2001	En route	KELLY	10nm SE	EGTT : London (FIR)	CESSNA	Turboprop	2	LH engine began to run roughly and was shut down. PAN call. Aircraft continued to Teesside and landed safely. Engine compressor and EGT harness replaced.	Pilot also reported difficulty in lowering landing gear. Initial troubleshooting carried out and no fault found. During subsequent flight, the fault re-appeared after 2.5hrs. Further troubleshooting carried out and engine compressor and EGT harness replaced. Intermittent fault on compressor plug suspected. Parts replaced and no further reports received. See also 200301777 and 2001/03589. □ CAA Closure: The hazard is adequately controlled by the actions stated above.
200103652	03/06/2001	En route	Uitoxeter (Staffordshire)	Nr	EGTT : London (FIR)	PARTENAVIA	Reciprocating	2	UK Reportable Accident : Engine failure. MAYDAY call. A/c substantially damaged during forced landing in field. 5 POB - 4 serious and 1 minor injuries. AAIB Field investigation.	At Meaux, the fuel uplift of 157 litres was placed in the left fuel tank. The aircraft was flown uneventfully towards Liverpool until the right engine lost power. The pilot turned about to land at Tatenhill but within a minute, the left engine also lost power. A forced landing ensued and the aircraft suffered major disruption and damage. When examined in situ, there was about 15 gallons of fuel in the left tank whereas the right tank was empty. The right fuel valve was in an intermediate position which permitted all the ports of the valve to be partly open simultaneously. When the right tank ran dry, the supply to the right engine was immediately interrupted and shortly afterwards, air was entrained into the left engine supply line from the right tank. This effect caused the double engine failure. Correct operation of the valves was dependent upon the adjustment of the teleflex actuating cables and the care with which the pilot operated the control knob. Two Safety Recommendations (2001-73 and 2001-74) were made that addressed correct synchronisation between the cockpit fuel selectors and fuel selector valves. See AAIB Bulletin 5/2002, ref: EW/C2001/6/02. □ CAA Closure: CAA FACTOR F8/2002, detailing the CAA responses to the two Safety Recommendations, was issued on 16 May 2002. Any further CAA action required will be progressed via the 'Annual Review of AAIB Recommendations' procedure.
200103825	05/06/2001	Approach	East Midlands (Derbyshire)		EGTT : London (FIR)	PIPER	Reciprocating	2	Major oil leak caused by gasket failure.	LH engine noted to be surging on approach. Engine shut down and aircraft landed safely. Inspection found engine covered in oil with only 1.5 litres remaining in engine. Oil filter removed and found to contain some seal debris. Filter replaced, oil system replenished and engine cleaned. On commencing ground run a major leak became apparent and the engine was immediately shut down. Investigation found that the oil filter converter plate seal had suffered a major failure. Gasket PN 06B23072 changed, converter plate cleaned and reinstalled along with a new filter. Oil replenished and ground run completed with no leaks apparent. FAA AD 2000-18-53 refers. The reporter replaced the gasket with Pt No 06B23072 as per Textron Lycoming SB 543A Supplement No 1 and completed the rectification action/ inspection in accordance with FAA AD 2000-18-53, and a re-inspection at 10 flying hrs. No further leaks were found. The reporter has suggested that all gaskets Pt No LW-13388 should be made life limited items or replaced with Pt No 06B23072. Reporter actions are satisfactory, no further action considered necessary at this time. □ CAA Closure: The hazard is adequately controlled by existing procedures.
200103947	13/06/2001	En route	Brampton		EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	2	RH engine fire caution illuminated in flight. Engine shutdown and aircraft carried out a run on landing.	No evidence of fire. False indication attributed to poor crimping at spot detector behind fuel pump and filter assembly. Wire inspected, cleaned and re-crimped to detector. System function tested satisfis.
200104105	01/06/2001	En route	London-Heathrow - LHR		EGTT : London (FIR)	BOEING	Turbofan	4	Nrs2 and 3 engines failed to shutdown immediately following operation of fire handles during air test.	Sixty five second delay evident during which time nrs2 and 3 engines continued to respond to thrust lever movement. No. 2 and No.3 fire handle assemblies changed. Wiring defect at No.2 engine fuel cut off switch repaired. Subsequent operation normal. Fleet records and air test results checked for previous occurrence of this nature. Considered to be an isolated occurrence. See also 1999/04753 and other related occurrences contained therein. □ CAA Closure: The hazard is acceptable provided the frequency remains low.
200104160	19/06/2001	En route	Liverpool (Merseyside)	5 W N W	EGTT : London (FIR)	PIPER	Reciprocating	2	Engine oil pressure warning. Engine shutdown. PAN call. Returned and landed safely.	
200104241	25/06/2001	En route	Chester		EGTT : London (FIR)	PIPER	Reciprocating	2	Double engine failure. Forced landing in field. No reported damage or injury to 2 POB.	AAIB AARF investigation. The aircraft was en-route from Biggin Hill to Liverpool in CAVOK conditions when the right engine began to surge. The pilot reported that the fuel flow appeared normal and he suspected a faulty propeller Constant Speed Unit (CSU). The right engine was shutdown and 10 minutes later the left engine displayed similar problems. The pilot identified a suitable field and a successful precautionary landing was carried out with no damage to the aircraft or injuries to the occupants. The pilot assessed the cause of the incident as fuel mismanagement in that he had not made changes to fuel tank selections at the appropriate time. See AAIB Bulletin 9/2001, ref: EW/G2001/06/31. The pilot accepted that it was his error that caused the double engine failure. Refresher training in engine failure drills, and in particular recognition and symptoms of fuel starvation, have been covered with the pilot to the operator's and the CAA's satisfaction. □ CAA Closure: The hazard is controlled by the actions stated above.
200104284	22/06/2001	En route			EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	2	In cruise nr2 engine chip caution illuminated on CWP. Checklist actioned, aircraft returned and carried out a run on landing.	Chip detector MPI1 found to have a small sliver of 'type 1' metal on it. Inspection of remaining chip detectors and oil filter carried out - no further particles found. Engine ground run for 15 minutes with no further indications, mag plugs inspected after ground run and found satisfactory. Aircraft released back to service. Presence of particles attributed to recent maintenance activity, including engine module replacement.
200105131	24/07/2001	En route	East Midlands		EGTT : London (FIR)	FOKKER	Turbofan	2	Nr1 engine shut down due oil pressure warning following hydraulic system 1 and 2 warning. MAYDAY declared and aircraft returned.	Emergency drills were being actioned, and Nr1 engine shutdown iaw procedures. Aircraft landed safely. Defect confirmed as an engine failure involving a faulty RH gearbox, whereby the starter idler gear had failed causing failure of the hydraulic pump and centrifugal breather leading to significant oil loss. The engine OEM has recommended that the subject gear is replaced at shop visit where the soft life of the EGB has exceeded 10,000 cycles. This recommendation has now been incorporated into the operator's Tay 620 mid-life update programme requirements. Nevertheless, some engines have passed through their mid-life update before this recommendation but the OEM has since assessed that there was effectively no risk of a double engine event. A formal policy statement with EMP revisions has now been issued by the OEM. Engine replaced. Strip report from OEM confirms failure of the starter idler gear. OEM now recommends that the subject gear be replaced at an engine shop visit where the 'soft life' of the EGB exceeds 10,000 cycles. OEM assessment confirms no retrospective action is necessary, but is subject to CAA agreement. □ CAA Closure: The hazard is controlled by the actions stated above.

200105142	24/07/2001	En route	Benson		EGTT : London (FIR)	EUROCOPTER	Turboshaft	2	FADEC failure in-flight.	From straight and level flight at 100kt, the aircraft wasput into a rapid, decelerating left turn with positive pitch applied to reduce speed and the collective lowered to maintain height. Within two seconds of commencing the turnthe warning gong sounded. The collective lever was raisedand the turn reduced with NR indicating above 115 and theLH FADEC fail caption displayed. LH FADEC failure confirmed - manual throttle selected and power reduced. Aircraft returned to base and carried out a single engine landing. See also 2001/06411 and 2001/06416. Turbomeca Alert Fax issued. These failures all result from flight crews not observing the AFM start procedures, resulting in FMU stepper motor position resolver error. Fleet embodiment of TU45 initially suspended but the fleet has since been modified with the incorporation of the further procedural changes required by the Alert SB. □ CAA Closure: The hazard is controlled by the actions stated above.
200105146	25/01/2001	En route	LATCC		EGTT : London (FIR)	AIRBUS	Turbofan	2	Single engine failure - PAN declared.	Following departure from Brussels a PAN was declared due to a single engine failure. The aircraft requested descentand returned to Brussels.
200105188	29/07/2001	En route	Cockfield (Suffolk)		EGTT : London (FIR)	OTHER	Reciprocating	1	UK Reportable Accident : Propeller separated in flight. Forced landing in field. No injury to 2 POB. AAIB AARF investigation.	The aircraft was at 1000ft amsl with the engine at its cruise setting of 6000 RPM and all indications normal when, without warning, a loud bang was heard and the engine began to overspeed. The pilot shut down the engine and made a successful forced landing. The propeller had separated from the engine and, when recovered, was found to be missing one blade. Metallurgical examination of the failed propeller attachment bolts indicated that the propeller had separated due to a progressive failure in fatigue of a number of the propeller mounting bolts. The remaining bolts had failed in overload, causing the sudden loss of the propeller. The most likely cause of the problem was incorrect torque tightening of the propeller mounting bolts, or looseningof the bolts in service, resulting in the propeller not seating correctly on the gearbox flange. The investigation established that the current method of attachment of the propeller provides the opportunity for incorrect torque tightening of the attachment bolts and there was also no requirement from the propeller manufacturer to routinely torque check the attachment bolts. The aircraft manufacturer has since introduced a modification to simplify the method of attachment of the propeller and the propeller manufacturer has also introduced a requirement for a routine torque check of the bolts. See AAIB Bulletin 4/2002, ref: EW/G2001/07/35. See also 200204181.
200105293	30/07/2001	En route	Blackpool (BPL)		EGTT : London (FIR)	PIPER	Reciprocating	2	RH engine low oil pressure/high temperature/reducing RPM - engine shutdown. PAN call. Aircraft landed safely with AFS in attendance.	Oil evident on RH engine cowlings after landing.
200105351	30/07/2001	En route	London FIR		EGTT : London (FIR)	BOEING	Turbofan	2	Oil quantity loss during climb. A/c returned. Oil filler cap not fitted correctly.	Oil quantity reduced in climb to 9qts. A/c levelled at FL150 and following consultation, decision taken to return. QRH drill actioned and single engine (1 engine at idle) flap 20 landing carried out at a weight of 95 tonnes. Engineshut down on runway with 1qt of oil remaining and all temperatures/pressures normal. Subsequent investigation revealed that oil filler cap was not fitted correctly.
200105611	13/08/2001	En route	Cranfield (CIT)	Nr	EGTT : London (FIR)	GRUMMAN	Reciprocating	2	LH engine shutdown due low fuel pressure. Landed safely with AFS in attendance.	
200105737	16/08/2001	Manoeuvring	Kemble		EGTT : London (FIR)	HAWKER	Turbofan	1	Engine stuck at max RPM and JPT regardless of throttle position. PAN declared. Aircraft returned.	On commencing aerobatic training, the engine became stuckat maximum RPM and JPT regardless of throttle position. PAN declared and aircraft returned to base. Aircraft positioned on short finals at 170kt and engine shut down using HP cock at 200ft. Aircraft touched down safely at thresholdand brake parachute deployed. Investigation revealed thata throttle linkage bolt had become detached from its lever assembly, allowing the lever to drop and the throttle tomove to a fully open position. The bolt (PN BA 59079) is screwed into the lever and locked using stainless steel 16SWG locking wire bent to a 'U' shape through aligning holes. The engine had been repaired in February 1990 at 450 hours and was subsequently removed from service in June 1993 for 'torching', having accumulated 600 hours. It was installed in this aircraft on 9 July 2001 with a 300 hour life left to overhaul. Full ground and air tests were completed after installation and the aircraft had flown a further3 hours 45 minutes up to the time of this incident. The bolt and lever are part of the temperature control actuatorassembly which is associated with the ECU. It is not disturbed on an engine change and is not part of an installation check. There were no witness marks on the bolt to show that the locking wire had sheared and no locking wire found in the aircraft. The reporter believes that, at some stage between 1993 and 2001, the assembly had been dismantledand reassembled without the locking wire being fitted. A fleet check was carried out and no other aircraft were found to be similarly affected.
200105980	16/08/2001	En route	Middle Wallop	1nm North	EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	1	Loss of engine oil pressure. Engine off landing carried out.	The engine oil pressure caption illuminated accompanied by an associated audio warning. The oil pressure gauge showed the pressure to be greater than 1.8 bar but rapidly falling below the red line and approaching zero. The instructor elected to carry out an engine off landing and entered autorotation while the student shut down the engine. A distress call was transmitted and the aircraft landed safely in a field. Investigation found the oil filter installation seal to be distorted and split. The reporter comments that no torque loading is given for this assembly and there is a tendency to overtighten which, over a period of time,has the effect of squeezing the seal out of shape and blocking the oil supply to the oil pressure transmitter and switch.
200106057	01/09/2001	En route	Marlborough (Wiltshire)	4nm NW	EGTT : London (FIR)	JODEL	Reciprocating	1	UK Reportable Accident : Rough running engine - shut down. MAYDAY call. Aircraft damaged during forced landing. No injury to 2 POB. AAIB AARF investigation.	During a VFR flight from White Waltham to a farm strip near Colerne the engine began to run roughly, with the vibration becoming so severe that the pilot had no option but to shut the engine down. He transmitted a MAYDAY call and selected a field in which to make a forced landing. However, as he approached the field, he realised that he would have to manoeuvre in an unsafe manner to effect a landing and so was forced to attempt a landing in another nearby area. On touchdown the left wing was low and the aircraft wasdrifting slightly to the right, which caused the LH MLG to collapse. Examination of the engine revealed that the head of an exhaust valve had detached, causing damage to thecylinder and piston. The engine Log Book showed that somethree years (72 operating hours) prior to the accident all the cylinders had been removed because of low compression and that a 'top end' overhaul had been carried out. Thisoverhaul had included lapping of all the valves and fitment of new piston rings. The engine had a total recorded time of some 1,080 hours at the time of the accident. See AAIB Bulletin 11/2001, ref: EW/G2001/09/01.
200106125	01/09/2001	En route	Gravesend		EGTT : London (FIR)	GRUMMAN	Reciprocating	2	LH engine RPM fluctuations and loss of oil pressure. Engine shut down. Aircraft returned.	In cruise LH engine RPM began to fluctuate between 2300 and 1900. Oil pressure was checked and found to be low and falling rapidly. Engine shut down, aircraft returned and landed safely. Dipstick showed oil quantity of 2.25 quarts and underside of aircraft was covered in oil. Engine had been on 7.5 quarts prior to departure. Investigation revealed failure of oil cooler matrix PN 8406R, causing oil leakage. Filter found free of contamination. Oil cooler changed.
200106204	06/09/2001	En route	Blackpool (BPL)	14nm W	EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	2	Nr1 engine chip llight illuminated. Engine shut down. PAN declared. Aircraft returned and landed safely.	
200106205	06/09/2001	En route	London-Gatwick - LGW		EGTT : London (FIR)	MCDONNELL DOUGLAS	Turbofan	3	Centre engine (Nr2) problem/shutdown. Descended to FL240.Emergency declared. Diverted and landed safely.	
200106250	07/09/2001	En route	East Midlands		EGTT : London (FIR)	BAE	Turbofan	4	Successive engine vibration warnings due to fan icing . PAN declared.	During climb from approx FL100 to FL260 in forecast moderate icing conditions (with engine anti-icing selected), MWS "ICE DETECTED" caution displayed at approx FL230 and airframe ice bleeds were selected on law standard procedures.With TMS selected to TGT mode/820deg and engine nr1 as Master, the aircraft climb performance became negligible at FL245 and a request for descent to FL240 was granted by ATC. At 220KIAS passing FL243, a sudden onset of airframe vibration was followed by an "ENG VIB" warning for nr3 engine at 1.3ips. All other engine indications remained normal and as nr3 engine thrust lever was reduced towards 80% N1 (whilst locating the applicable AEP Drill Card 8B), the associated vibration level reduced. On reaching FL240, a further vibration warning occurred, this time for nr2 engine with 2.0ips indicated. PAN declared with request to ATC for further descent, which was given initially to FL190 and later to FL150. At descent thrust settings, all engine vibration levels were observed to be near normal. At FL150, clear of icing conditions, and with indicated OAT of +05 deg C, increased thrust on all engines to normal cruise level produced fully normal indications on all engines. PAN status was cancelled and flight proceeded uneventfully to planned destination with a second climb to FL240 clear of the previously encountered weather system. Initial Company Investigation has established that there appears to have been a higher than normal - but not exceptional - moisturecontent in the cloud layer through which the aircraft wasflying at the time of the onset of vibration. Reporter suspects fan icing, and the FDR record has been quarantined for possible use during further investigations. Recurred 29 Oct 2001 (2001/06250). Investigation concluded that icing of the fan blades was possibly caused the vibration. Engine trends were reviewed, but no significant trend was noted. Engine chip detectors and band adjustment were checked.□ CAA Closure: The hazard is adequately controlled by theactions stated above.
200106377	07/09/2001	En route	Otringham (OTR)	Between OTR & BLUFA	EGTT : London (FIR)	BAE	Turbofan	4	A/c performance degraded during climb in icing conditionswith TGT 830 set.	A/c was in climb in Vertical Speed (VS) mode, between FL200 and FL250, in moderate to severe icing conditions (ice visible on windscreen probe) with engine and airframe anti-ice selected. Airspeed at FL200 was approx 240kts IAS andcrew were aware of reducing airspeed. At approx FL230, IAS mode was selected with airspeed 210kts IAS. TGT was increased in stages from TGT 800 to TGT 830 between FL230 and FL250 to counter an ROC of less than 500fpm. On approaching FL250, low engine parameters were noted and so permission requested from ATC for a/c to level at FL250 to allow time to analyse problem. Crew then requested descent to FL230 where engines recovered. Investigation found No2 engine bleed band found to be out of limits by 3% at top end. Adjusted to 1% over lower limit i.a.w. the manufacturers recommendations i.a.w. AMM 73-20-01 P501. □ CAA Closure: The hazard is controlled by the reporter's actions.

200106501	17/09/2001	En route	Porthcawl		EGTT : London (FIR)	PIPER	Reciprocating	1	PAN declared due to rough running engine. Subsequently upgraded to MAYDAY with engine failure. Aircraft made forcedlanding on beach.	
200106627	12/09/2001	En route	Axbridge		EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	2	Nr1 engine chip warning. Checklist action. Warning persisted. Engine shutdown. Landed safely.	Bottom mag plug contaminated with particle. Plug cleaned and refitted. Ground run and hover checks carried out satisfactory.
200106739	22/09/2001	Take-off	Benson		EGTT : London (FIR)	EUROCOPTER	Turboshaft	2	RH engine chip caption illuminated during initial climb. Power reduced to idle then low oil pressure caption illuminated. RH engine shutdown, aircraft returned.	Engine chip detector and oil filter inspected - small particle found on one chip plug and fine ferrous material found in filter. Engine oil pressure check found acceptable -pressure transmitter changed. The engine had returned from repair 12 hours previously and metal generation is considered to be build debris.
200106775	27/09/2001	Manoeuvring	Rhuddlan		EGTT : London (FIR)	EUROCOPTER	Turboshaft	2	FADEC failure.	Nr2 FADEC froze at 22% on lifting into hover following running landing. Nr2 engine shutdown and aircraft landed safely. Aircraft shutdown and when FADECs were re-initialisedall captions were clear. Aircraft restarted and flown on to helipad with no recurrence. Aircraft was pre mod TU45 -suspect HMU changed.
200106798	28/09/2001	En route	KENET		EGTT : London (FIR)	BAE	Turbofan	4	PAN call due engine shutdown. A/c returned and landed safely.	
200107032	16/09/2001	En route			EGTT : London (FIR)	LOCKHEED	Turboprop	4	Nr4 engine failure in the cruise. Normal shut down drill carried out.	Investigation revealed that the turbine coupling shaft PN6829527 had failed 2 inches forward of the turbine front bearing and the turbine to compressor tie bolt had failed at about the same location. The front turbine bearing had failed completely, generating sufficient heat to flatten the rollers into an oblong shape and leaving evidence of tremendous heat throughout the area. The turbine coupling splines were deformed, having detached from the coupling shaft which itself was deformed in a manner suggesting it wasalmost molten prior to failure. The tie bolt was bent through 90deg at the point of failure due to heat and centrifugal forces and had cut through the combustion inner linerand half way into the combustion cans. The turbine rotor had dropped and the blade tips were touching the outer case, while the inlet case centre was slightly twisted where it attaches through the support to the outer case. The first stage turbine blades were broken off towards the tips, with the debris causing damage to the other stages. The rear bearing, although still oiled, had got very hot and therollers were flattened. The rear scavenge oil pump casingwas broken and the pump was full of metal; the pump support and stud was broken and the insulator damaged. The oil feed pipe jet to the rear bearing was checked and found clear. Although badly damaged due to the failure of the coupling shaft and tie bolt, and the consequent rotation of the combustion chamber inner casing, the oil feed pipe appeared to have no restriction. The two jets which feed the front and rear of the forward bearing were also clear. It was concluded that the coupling shaft and tie bolt had failed because the failure of the turbine front bearing had created tremendous heat, weakening the materials. No cause could be found for the bearing failure or for the lack of oil which could have caused the bearing failure. Shaft failure resulting from failure of nr3 bearing. Engine shut downsafely and the manufacturer informed of the event who have stated that due to the single spool design there is no risk of overspeed. Failure of nr3 bearing probably due to oil starvation. Possible causes of oil starvation due to build error were reviewed by the overhauler who had carried out the previous engine build. Actions identified have been adopted by the company. IFSD rate of RRC501-D13 engine is acceptable. See also 200402425.□ CAA Closure: The hazardsis acceptable provided the frequency remains low.
200107290	22/10/2001	En route	Mayfield (MAY)	2 N	EGTT : London (FIR)	ATR	Turboprop	2	Nr1 engine stall/surge together with torque increasing byapprox 10% and aircraft yaw. MAYDAY declared. Engine shutdown. Single engine landing carried out. P1 sense line and sensor contaminated.	On passing 3500ft with both power levers set to flight idle the nr1 engine began to stall/surge with torque indication increasing by approx 10% and a/c yaw. Checklist actioned. MAYDAY declared. Engine shutdown, aircraft landed safely at London Gatwick. Fault traced to P1-8 sense line contamination plus P1-8 probe (p/n 3034652) carbon contaminated. Flight test carried out. No further problems.□ CAA Closure: Hazard controlled by reporters actions.
200107489	15/10/2001	En route	Oxford		EGTT : London (FIR)	PIPER	Reciprocating	2	RH engine oil pressure and RPM decreased. Engine shut down and PAN call transmitted. Aircraft landed safely with AFS in attendance.	Loss of oil pressure traced to sheared drive to engine oil pump. The crankshaft gear (PN 630690) was found to have lost one tooth which had fallen between the oil pump cover(PN 633612) and gear drive (PN 640926), causing the oil pump drive failure. Crankshaft and camshaft gears changed. new oil pump assembly fitted and ground runs carried out with satisfactory results. However, the engine was subsequently replaced at engine manufacturer's recommendation and the engine operating procedures discussed with the manufacturer's representative. The maintenance organisation confirm that they have had three linked events, two of which were reported as MORs (see also 200108290). The three eventswere all on right hand engines and have been traced to the single engine climb procedures of the Training School (sister company to the maintenance organisation). The revisions to the procedures have reduced the frequency and impact of throttle slams and low rpm/high MAP during single engine climb training. The company have also stopped AN35 extensions beyond manufacturers TBO for these engines. See also 200206171.□ CAA Closure: The hazard is adequately controlled by the actions stated above.
200107532	02/11/2001	En route	Stansted	60 W	EGTT : London (FIR)	OTHER	Unknown		PAN declared due engine shutdown.	
200107556	27/10/2001	En route	Wycombe	2nm N	EGTT : London (FIR)	SCHEIBE	Reciprocating	1	Smoke in cockpit. Engine shut down. MAYDAY call. Aircraftdiverted and landed safely with AFS in attendance. Enginecoolant leaked onto exhaust.	The LH radiator hose adjacent to the exhaust pipe had burned through, causing coolant leakage onto the exhaust stack. It was noted that, with the exhaust correctly fitted, there is a 10mm gap between the rubber radiator hose and the exhaust. However, it is possible to assemble the exhaustso that the two items are in contact, as seems to have occurred in this case. The aircraft was newly constructed, having flown approx 10 hours. The problem was referred to the aircraft manufacturer, Scheibe-Flugzeugbau - G.M.B.H, who confirmed that incorrect installation of the exhaust onNo 2 cylinder had caused contact between the exhaust anda cooling hose. This had resulted in the coolant leakage.The manufacturer also confirmed that the exhaust had beencorrectly installed at manufacture i.a.w. the manufacturers procedures but had been replaced by the maintenance organisation prior to this flight. There have been no similaroccurrences on the world fleet. Nevertheless, the maintenance downfall has been followed up and appropriate action taken to prevent a recurrence.□ CAA Closure: The hazard iscontrolled by the actions stated above.
200107719	17/10/2001	En route	Chivenor	10 N	EGTT : London (FIR)	BOLKOW	Turboshaft	2	Nr2 engine ran down. PAN declared. Engine shutdown, aircraft diverted.	Aircraft on a positioning flight from RAF Valley to RAF St Mawgan. Approximately 25m N of Chivenor, decision made to divert to Chivenor, due to strong headwinds, indicating that fuel remaining for continued direct flight to St Mawgan was marginal. A/c climbed to 3000ft on 1013mb to carry out an engineering power assurance check . Once check completed a/c returned to cruise condition and a gentle descent was carried out to 1500ft. After approximately 3-5 minutes in the cruise nr2 engine N2 fell to approximately 90% and torque to approximately 20% together with torque audio warnings. Engine then recovered to normal parameters. Approximately 5 seconds later nr2 engine gently ran down to zero in 6-8 seconds with no abnormal indications. PAN declared, engine shutdown. Landed safely with AFS in attendance.HP fuel line at engine fuel nozzle disconnected, engine vent run carried out - no fuel observed. Engine fuel systembled, fuel flow established but assessed as below limits.Nr2 fuel control unit (FCU) , PN 23034702, changed. Engine fuel system bled and extended ground runs carried out satisfactory. Shortly after take off for power assurance test flight the crew reported hearing a bang from the rear ofthe a/c - all indications normal. Subsequent a/c inspection failed to identify source of bang. Further test flight,power assurance and general handling checks carried out satisfactory. Bench test of nr2 FCU established no defect. The fuel flow was measured and found to be within 1.5% of optimum, and thus considered acceptable.
200107802	06/11/2001	Approach	Leeds Bradford (LBA)		EGTT : London (FIR)	PIPER	Reciprocating	2	LH MLG green failed to light on LG extension. Go around flown. LG recycled to no effect. Flypast inspection confirmed gear down. LH engine shutdown. 3 greens obtained on landing. AFS in attendance.	LH MLG lubricated and retraction checks carried out satisfactory. Operators fleet check carried out satisfactory. See also 200205329 for a similar event on the same aircraft.
200107897	14/11/2001	Approach	Blackpool (BPL)		EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	2	Nr2 engine chip warning during approach. Engine shut down. Run on landing carried out.	
200108194	05/12/2001	En route	Isle Of Man (IOM) (Isle of Man)	10nm SE	EGTT : London (FIR)	FOKKER	Turboprop	2	Nr2 engine fire warning in flight. MAYDAY declared. Fire drill actioned but warning persisted. Engine shut down, aircraft returned and landed safely. No evidence of fire.	Engineering investigation revealed a short circuit in a section of thenr2 engine fire loop. Section replaced.□ CAA Closure: The hazard is adequately controlled by the actions stated above.
200108258	06/12/2001	En route	North Sea		EGTT : London (FIR)	SIKORSKY	Turboshaft	2	Nr2 engine chip warning. Engine shutdown. Landed safely.	
200108290	28/11/2001	En route	Coventry		EGTT : London (FIR)	PIPER	Reciprocating	2	RH engine power loss and suspected fire. Engine shutdown. Emergency declared.	At bottom of descent, with 21" MAP applied, a tremor and right yaw was experienced. 34" Manifold Air Pressure (MAP)selected as unable to maintain 2500ft. Yaw was controllable and both engine indications were normal. Alternate air selected with ice drill and mixture set to rich. A/c levelat 2500ft, 34" MAP/2400/110kts. ATC advised. RH engine rpm fell to 2200 but was reinstated using manual propeller control. LH engine also exercised as a check. Sortie cancelled and return to base initiated. Student in rear of the a/c called smoke but instructor was unable to verify this due to light reflection on perspex. Student then observed asuspected fire and instructor confirmed a red glow from RH engine. Emergency declared, a/c turned back towards Coventry and engine shutdown. Landed safely. LH magneto on RH engine had sheared away from the engine causing oil to drip onto the hot exhaust. Engine assembly including frame replaced and a/c returned to base. Investigation of damage to engine revealed that gearing in rear case had fractured.Engine returned to manufacturer for investigation. The maintenance organisation confirm that they have had three linked events, two of which were reported as MORs. The threeevents were all on RH engines and have been traced to thesingle engine (S/E) climb procedures of the Training School sister company to the maintenance organisation. The revisions to the procedures have reduced the frequency and impact of throttle slams and low rpm/high MAP during single engine climb training. The company have also stopped AN35 extensions beyond manufacturers TBO for these engines. Seealso 200206171and 200107489.□ CAA Closure: The hazard is adequately controlled by the actions stated above.

200108363	13/12/2001	En route	Bournemouth		EGTT : London (FIR)	FOKKER	Turboprop	2	Nr2 engine shutdown due to fluctuating TGT and fuel flow indications. MAYDAY declared, aircraft returned and landed safely.	
200200078	08/01/2002	En route			EGTT : London (FIR)	DE HAVILLAND	Turboprop	2	Loss of nr2 engine oil pressure. Engine shut down. MAYDAY declared. Aircraft returned and landed safely with AFS inattendence. Oil pressure transmitter faulty.	Approaching FL100, nr2 engine oil pressure was seen to belower than normal and to then fall steadily towards zero.A request was made to ATC to return to the departure airfield. The oil pressure indicator then rose from just abovezero to 20psi and a surging noise was heard from the right side of the aircraft. There was no low oil pressure warning and no other indications of nr2 engine malfunction. The nr2 engine was then shut down in line with the flight crew reading of the requirement for this action. ATC clearance was given for a direct routing to the departure airfield where a single engine landing was made with no further incident. AFS attended aircraft, found no abnormalities andescorted aircraft to stand. Initial investigation established that the nr2 engine was not malfunctioning and that the IFSD action was not required by the emergency/abnormal checklist. The nr2 engine oil pressure transmitter was subsequently found to be faulty and was replaced. The transducer is located below the oil filler and in this case it was apparent that the appropriate sealant had not been applied to the electrical connection on the transducer and oil contamination of the electrical connector had occurred. Company SOPs state that two independent indications are required for a full engine shutdown after an 'oil warning' butduring the crew de-brief it became apparent that the presentation of the applicable drill in the Emergency/Abnormalchecklist could be considered ambiguous. This has therefore been clarified by a minor change to the presentation ofthe applicable QRH and a FOB issued to alert crews to thechange. ETR TS4672 was also issued requiring an inspection of the engine electrical connections for application of self-vulcanising tape on all aircraft of fleet and TI D83-71-01 issued detailing application requirement of self-vulcanising tape.
200200420	27/01/2002	Take-off	Exeter		EGTT : London (FIR)	BAE	Turbofan	4	Nr1 engine vibration warning - indicator off-scale. Engine shut down, aircraft returned. Vibration harness cable found chafed against a 'P' clip.	Shortly after take-off the engine vibration warning illuminated on MWS. No 1 engine vibration indicator was givingan off scale reading. With power lever retarded to idle the vibration indication decreased to normal. However, the vibration level increased after a short while and the engine was shut down and the aircraft returned to Exeter. Engineer's inspection found the indicator had not returned to zero with the engine shut down. Vibration harness Pt No 6917M106 replaced, engine ground runs carried out, all indications normal. Further inspection of the original harness found the cable had chafed against a 'P' clip and the outer braid has shorted against the inner conductive core. Probable cause of chafing is considered the tighter bend radius in the harness routing. Considered an isolated incident as there are no other similar recorded incidents on the database.☐ CAA Closure: The hazard is acceptable provided the frequency remains low.
200200902	11/02/2002	En route	Cambridge		EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	2	RH engine chip warning. Checklist actioned, warning cleared briefly then recurred. Engine Shutdown. A/c returned and landed safely.	Lower chip plug contaminated with 'light fuzz'. Chip plugs cleaned/refitted, ground runs carried out satisfactory. Subsequent inspection of chip plugs satisfactory.
200201540	19/02/2002	Take-off	Stapleford	3nm W	EGTT : London (FIR)	PIPER	Reciprocating	2	LH engine shut down due loss of Manifold Air Pressure (MAP). Aircraft returned. Filter contaminated with metallic debris.	During climb out, a reduction of 2 or 3" MAP was seen, felt and heard from LH engine. Throttle was advanced to balance with RH MAP and then LH MAP fell again. Aircraft was turned back towards airport when it was noticed that maximum MAP available from LH engine was 30". Oil warning light then illuminated and pressure fell to a very low indication therefore LH engine was shut down as a precaution. Uneventful single engine landing carried out. Initial inspection revealed metallic particles in filter. Engine to be removed and despatched for strip report. Total engine hours 808, total engine hours since inspection 4.
200202258	14/04/2002	En route	Harpenden (Hertfordshire)		EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	2	Nr2 engine shut down following high oil temperature indications on both engines. PAN declared. Emergency single engine landing during in-flight return. No injuries.	In cruise at 1500ft, high oil temperatures (approaching 107deg C continuous limit) were noted on both engines. Emergency checklist consulted and aircraft turned back towardsdeparture airfield. Nr1 engine oil temperature was now above 107deg C, therefore nr1 FFCL was reduced to idle and aPAN was declared. Nr2 engine oil temperature had by now also risen above 107deg C limit, although nr1 engine oil temperature had responded to lower power setting and had cooled slightly. Nr2 engine oil temperature reached 120deg C,therefore nr1 engine was reinstated and nr2 engine was shut down. A single engine emergency landing was then carried out in a nearby field (with nr1 engine oil temperature approaching 120deg C maximum). A smell of smoke was evidentduring subsequent evacuation. No reported injuries or damage to aircraft. Investigation revealed that the first stage oil cooler fan wheel p/n VT160-40-12C (housing shroud) had ruptured. Each of the fan blades had failed at its root end. Inspection of the surrounding area and debris revealed no obvious reason for this, and oil lines disclosed nofurther damage, the rupture of the shroud having contained the energy of the fan failure. The type certificate holder has been informed but to date no further information has been forthcoming. As the maintenance organisation has noexperience of a similar occurrence, and there are no related events on the MOR database, this is considered an isolated incident. The MOR will be reopened if subsequent information requires further investigation.☐ CAA Closure: The hazard is acceptable provided the frequency remains low.
200202403	21/04/2002	En route	London-Heathrow - LHR		EGTT : London (FIR)	AIRBUS	Turbofan	2	Shortly after take off there was a significant increase in nr2 engine N2 accompanied by high vibration. MAYDAY declared. Aircraft returned. AAIB AARF investigation.	AAIB Bulletin 7/2004, ref: EW/G2002/04/11 - Summary: Three to four minutes after take off the commander noticed a significant increase in HP spool vibration indications for the right engine. A few seconds later, passing 3,500 feet,the engine surged. The commander did the 'Stall Reduction' procedure and retarded the nr2 engine to flight idle. Immediately the vibration and noise ceased and, with the engine remaining at idle, he made a landing back on Runway 27L at Heathrow. Strip examination of the engine confirmed afailure of the nr4 bearing and initial examination of thebearing indicated that spalling of the bearing outer race, leading to spalling of the rollers was responsible for the failure, which then resulted in failure of the cage spacers and, consequently, to skidding of the rollers. The reason for the initial outer race spalling could not be established. The engine had been in service for 1,033 hours/751 cycles since new. From 1998 to April 2002 there were 15 failures of nr4 bearings on CFM56-7 engines, with many more on other CFM56 models. Although regarded as unsatisfactory, this represented less than 1% of the bearing population with an MTBF of 800,000 hours. Over 80% of failures occurred within 6,000 hours of installation, of which more than half failed within 2,000 hours. There was little difference between the failure rates in new or overhauled engines. In October 1999, a Service Memorandum (CESM No.054) was issued on the subject of Optimizing Bearing Care - Good Practices, describing practices which minimised the potential for damage to be caused to bearings during workshop visits, transport and storage. Since the introduction of thesechanges an improvement in the reliability of nr4 bearingshas been observed. In another endeavour to reduce the in-flight shutdown rate, the manufacturer had developed a portable vibration monitoring tool to detect incipient failures of nr4 bearings, for use in test-cells or during groundruns and this is being further developed for use in flight. See also 200201195.
200202574	26/04/2002	Approach	Isle of Man (IOM)		EGTT : London (FIR)	PIPER	Reciprocating	2	Engine shut down due to oil leak. Aircraft returned and landed safely.	
200202702	23/04/2002	En route	Manston	11nm SSW	EGTT : London (FIR)	PIPER	Reciprocating	2	Unable to restart engine following shut down as part of air test. PAN declared, aircraft diverted to Manston and landed safely.	
200202869	07/05/2002	En route	Honiley (HON)		EGTT : London (FIR)	BAE	Turbofan	4	Nr3 engine shut down due to low oil pressure and quantity. Oil leak detected.	In cruise at FL230, nr3 engine oil low pressure warning illuminated and both pressure and quantity gauges confirmedlow. The relevant checklist action was carried out and nr3 engine was shut down. Uneventful approach and landing carried out. Engineering inspection found nr3 engine oil tank empty and confirmed that there was a significant oil leak from the chip detector housing to the oil pump fitting. It was established that the leak was due to the nr3 enginefull flow chip detector housing becoming detached from the oil pump p/n 2-193-810-02 due to incorrect helicoil inserts having been fitted in the oil pump body. Four weeks earlier, a similar leak had been cured by re-torquing the oil pump body securing screws. It is believed that the oil pump was fitted during original manufacture and no that maintenance had been carried out on the oil pump at the last engine overhaul. Technical Instruction TI 146-79-04 issuedto advise personnel that any oil leak from the full flow chip detector must be treated as an indication of potential oil pump failure.
200203241	17/05/2002	Approach	Exeter		EGTT : London (FIR)	BEECH	Reciprocating	2	LH engine shut down during circuit training detail.	Crew informed ATC and confirmed that this was not a practice exercise. Aircraft immediately cleared for landing andfull emergency procedure initiated by ATC. Uneventful landing with fire services in attendance.
200203522	03/05/2002	En route	Manchester (MCT)		EGTT : London (FIR)	PIPER	Reciprocating	2	Loss of power causing aircraft to yaw to the right duringcruise. RH engine shut down. Diversion. Icing suspected.	During cruise at FL90, manifold pressure started to reduce from 31 ins to approx 20 ins and the aircraft yawed to the right. All annunciator and engine indications appeared normal. Fuel pumps were selected on and tanks were changed. Throttle was then increased but no power was being produced, therefore alternate air was selected on but no changewas observed. RH engine was shut down, checks were completed and aircraft diverted to Manchester. During descent large amounts of ice were observed to detach from RH side ofaircraft. Auto, manual and alternate air selectors testedsatisfactorily on the ground. Reporter confirms that thisis the first incident of this kind in 15 years of aircraft operation in icing conditions and suggests more importance should be placed on operation of alternate air selection during ground run-up.
200203610	04/06/2002	En route	Compton (CPT)	15nm NE	EGTT : London (FIR)	BAE	Turboprop	2	Nr2 engine oil pressure fluctuated/decreased. Engine shutdown. MAYDAY declared. Aircraft returned and landed safely.	Passing FL100, nr2 engine oil pressure fluctuations occurred followed shortly afterwards by zero oil pressure indication. Checklist actioned, engine shut down and return initiated. Engineering inspection found no fault. ADD B375 raised and subsequently nr2 engine oil pressure transducer p/n 124101-2 was replaced. Considered a random fault. The manufacturer identified that the crew need not have shut the engine down in flight. The AFM Abnormal/Emergency Procedures confirms that engine need not have been shut down dueto a single indication with no corresponding oil pressureCAP warning or other engine indication. The report also indicated that the operator has counselled the flight crew subsequent to this event to ensure that they are aware of correct procedures.☐ CAA Closure: The hazard is acceptableprovided the frequency remains low.

200203831	05/06/2002	En route	Exeter		EGTT : London (FIR)	BOLKOW	Turboshaft	2	Nr1 engine mag light illuminated. 'Fuzz' burner activatedbut light did not clear. Engine shut down, aircraft landed safely.	Nr1 engine mag plugs removed, cleaned and refitted. Thirty minute ground run carried out with no recurrence.
200203845	08/06/2002	En route	Manchester (MCT)		EGTT : London (FIR)	AIRBUS	Turbofan	2	Engine shutdown. PAN declared and the aircraft returned.	During the climb, the aircraft was cleared to FL190 but the flight crew requested that they maintain FL160, reporting engine trouble. They later advised they were flying on one engine, a PAN was declared and the aircraft returned to the departure airport.
200203865	10/06/2002	En route	Isle of Man (IOM)		EGTT : London (FIR)	SWEARINGEN	Turboprop	2	Spurious RH engine fire warning. Fire detector element wiring chafed.	While descending through 1600 ft the RH engine fire warning light illuminated and the bell sounded intermittently. Attempts to cancel the bell failed and the warning light continued to flicker. The RH engine was shutdown and a MAYDAY declared. All warning indications then ceased and a visual examination confirmed no fire, therefore the fire extinguisher was not operated. A single engine landing was completed with the fire services in attendance, with the aircraft being shutdown on the runway where the passengers were evacuated. Engineering examination found that the fire detector element wiring was chafed at a point where the wiring was secured to the engine throttle control cable support structure by a ty-wrap. The cable was temporarily repaired prior to a permanent repair and cable replacement.
200203976	11/06/2002	En route	Kings Lynn		EGTT : London (FIR)	BAE	Turboprop	2	Uncommanded increase in LH engine RPM followed by 'BETA' amber caution. Emergency declared, engine shut down. Aircraft landed safely with AFS in attendance. P3 pipe failed.	Descending through FL120 with engine torque set at 60%, the LH engine began an uncommanded increase in RPM from normal 97% to 99%. This was followed by a 'BETA' amber caution. QRH actioned, emergency declared and engine shut down. Aircraft landed safely with AFS in attendance. Investigation revealed that the P3 pipe had sheared at the weld in the flange where it is secured to the engine casing, allowing hot air to escape into the zone 1 area around the engine. Inspection of the zone 1 compartment showed evidence ofhot air damage to the insulation and heat shrink tubing on various wires/cables/looms along through right side of the engine. P3 pipe replaced and appropriate repairs effected. Engine ground run carried out with satisfactory results. See also 200207287, 200007700 and 199701200.
200204108	28/05/2002	En route	Ilkley		EGTT : London (FIR)	BOLKOW	Turboshaft	2	PAN declared with one engine shut down. Priority approachgiven and aircraft landed safely.	Precautionary shutdown of nr2 engine due MAG plug illumination. Small sliver of metal found on MAG plug - plug cleaned and ground run carried out satisfactorily. Aircraft returned to service and no further problems reported.☐ CAA Closure: The hazard is controlled by the actions stated above.
200204338	27/06/2002	En route	Sheffield	10 N E	EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	2	Aircraft returned with engine shutdown. Landed safely.	
200204392	01/07/2002	En route	Warton		EGTT : London (FIR)	BAE	Turbofan	4	Nr1 engine shut down due to vibration. PAN declared. Aircraft returned.	Passing 5000ft during climb out, nr1 engine amber "VIB" caption illuminated on the MWS with the vibration monitor reading 2.0. Nr1 engine power lever was retarded and the vibration reading reduced to 1.5. The emergency checklist for an inflight shut down was then actioned and a PAN declared. The aircraft was then flown in the holding pattern for30 minutes to reduce the aircraft weight to maximum landing weight before an uneventful landing was carried out. Nr1 engine accelerometer plug removed, inspected and found to be slightly dirty and wet. Plug and socket cleaned, dried and refitted. Engine oil chip detectors and wiring from accelerometer to vibration monitor checked and found to bein satisfactory condition. Nr1 engine fire bottle and cartridge unit, which had been accidentally discharged when shutting down the engine due to in-flight turbulence, were replaced. The engines were then run to high power for 5-7 minutes with nr1 vibration level reading of 0.4.
200204409	30/06/2002	En route	WELIN		EGTT : London (FIR)	FOKKER	Turbofan	2	Nr2 engine failed to respond to thrust lever movement during descent. PAN declared. CASC (engine fuel flow regulator) failed, and was replaced.	On levelling off at FL200 during descent, a large disparity was noted in thrust levers and engine parameters between nr1 and nr2 engines. The autothrottle system was disconnected and descent continued. Nr2 engine would not then respond to thrust lever movement - only 1.16 EPR obtained with TGT 445deg, N1 53.9 and N2 79.1 with the thrust lever onthe forward mechanical stop. Reporter comments that thereis no appropriate procedure in the QRH, therefore PAN declared and a single engine approach and landing carried out. The Maintenance Organisation report reference 0351-02 dated 12/12/02 fully details the actions taken with respect to this occurrence. In summary: CASC (engine fuel flow regulator) replaced, failure confirmed by strip report (internal gear failure). History of the part indicates a low modification state with a life in excess of 20,000 hours. Theengine manufacturer's and operator's EMP both include an overhaul life of 13,000 hours. This lease engine was fitted to the aircraft approx 2 years ago and at the time the component life data was limited to 'hard time' only and notservice lives. This matter has now been addressed by Engine Manufacturer to ensure that all data is now supplied, and the operator's EMP includes the service life for this component. The operator has checked all other aircraft and found no further occurrences of this nature. Re. 'the flight crew comment " no QRH procedure". This comment highlights the lack of QRH/MFDS guidance on fixing this particular problem, but as there is no fix available none can be applied. The crew carried out a SE approach and landing without shutting down the affected engine, to assure full electrical and hydraulic system operation from the idling engine. The operator's fleet captain does not consider this issue as one that needs any further investigation or action bythe CAA.☐ CAA Closure: The hazard is adequately controlled by the actions stated above.
200204908	15/07/2002	En route			EGTT : London (FIR)	LOCKHEED	Turboprop	4	PAN declared with one engine shut down.	
200204987	15/07/2002	En route	Plymouth	Nr	EGTT : London (FIR)	MBB	Turboshaft	2	Nr1 engine chip warning illuminated. Engine shutdown. Aircraft returned.	Minute sliver of metal found on upper mag plug - cleaned and refitted. Ground run at flight idle carried out, satisfactory. Engine recently installed following complete overhaul.
200205073	18/07/2002	En route	Farnborough	4 W	EGTT : London (FIR)	AGUSTA	Turboshaft	2	Engine chip detector warning. Engine shutdown. Aircraft returned.	
200205126	22/07/2002	Approach	Otringham (OTR)		EGTT : London (FIR)	SIKORSKY	Turboshaft	2	Nr1 engine chip caption illuminated. Engine shutdown.	Nr1 engine chip light illuminated. Engine chip CB pulled/reset and engine beeped to min with no secondary indications. Engine shutdown when aircraft established on ILS.
200205399	24/07/2002	En route	Bristol Filton (Avon)		EGTT : London (FIR)	AIRBUS	Turbofan	2	PAN declared during air test. Aircraft returned with LH engine shut down. Smoke seen from RH MLG after landing. "2 metal objects" from MLG later found near R/W27 threshold. Brake unit failed.	The subject aircraft was on a CAA Airtest required prior to the issue of the Certificate of Airworthiness (C of A) and acceptance of the aircraft by the operator to it's fleet. The defective engine was changed and was dispatched tothe asset management company who did not respond to operator requests for further information. The sub-contract engineering department (BAe Filton)considered the defect to be fuel management related but the engine was changed on commercial grounds before any trouble-shooting of the specific defect could take place. No further action is thereforeproposed with respect to this aspect of the incident. Operator engineering investigation into the brake system defect revealed a seized brake unit with partial disintegration evident which had in turn damaged the companion wheel and tyre assembly. Strip investigation of the associated components revealed a number of defects which resulted in thebrake unit being scrapped. The wheel assembly required a replacement outboard hub and overhaul of the inboard hub. Due to the level of damage to the brake unit, the overhaulorganisation were not able to conclusively identify the root cause of the failure, however there was evidence that the brake unit may have been operated at some time previous below the wear limitations as the wear pins that survived the seizure were seen to be below flush. It could not beconfirmed however that this was the condition prior to the subject flight on the basis that significant wear could have been a result of the unit seizure. Considered to be an isolated case. No further action proposed. ☐ CAA Closure: The hazard is adequately controlled by the actions stated above.
200205487	04/08/2002	Take-off	Cosford		EGTT : London (FIR)	EUROCOPTER	Turboshaft	2	Nr1 engine FADEC failure followed by nr1 engine instrument indication (FLI) failure. HMU/EECU matching problem suspected.	Just after take-off from helipad, nr2 engine was selectedto idle. Nr1 engine spooled up to compensate and then nr1engine FADEC failed as the collective was lowered to keepnr1 engine within limits. NR was controlled, nr2 engine was restored to flight idle, nr1 engine was selected to manual throttle and aircraft recovered. Whilst in flight, FLIcontinued to indicate normally, then on landing, as nr1 engine was selected to minimum flow on manual throttle, nr1FLI failed. Nr1 engine was shut down using twist grip, nr1 FADEC was recycled and all indications were then normal.Approx 5 minutes prior to this both FADECs had been de-saturated by selecting both engines to manual. HMU/EECU matching problem suspected - HMU (p/n 0319928480) changed - removed item to be returned to the manufacturer for investigation. Total aircraft/component hours/landings 469.75/2014. Manufacturer advised. See also 200208319
200205596	05/08/2002	Take-off	Luton (LUT)		EGTT : London (FIR)	SHORT	Turboprop	2	RTO at 55kts due to RH engine fire warning. Recurring fault.	Just after take-off power was set during take-off roll, RH engine fire warning activated. The take-off was aborted,appropriate procedures were carried out and the aircraft was evacuated. The engine was immediately inspected, but no sign of fire or leaks were evident and the warning did not sound with the power on. The engine was re-inspected the following day, but again no fault was found. The forwardsection of the fire detector was replaced as a precautontogether with the fire bottles. During subsequent engine ground run an intermittent fault was found with the test switch. The switch was replaced and subsequent ground run satisfactorily carried out with no fault evident during next flight. The engine was re-inspected the following day and again no fault was found. Further flights satisfactorilycompleted. Investigation progressed under 200205438 (sameaircraft).
200205911	19/08/2002	En route	Luton (LUT)	25 S E	EGTT : London (FIR)	CESSNA	Turboprop	2	RH engine oil loss. Engine shutdown. Diverted. Oil filler cap/dipstick not secured correctly.	Oil seen leaking from under the RH engine oil filler flap. Engine shutdown, diverted. Inspection found that the oilfiller cap/dipstick had not been correctly secured. Following consultation with engineering, oil replenished and ground run carried out satisfactory. Remainder of the flight was monitored/uneventful. Engineering investigation carried out on return to base followed by low power and maximum power ground runs - satisfactory.
200206021	21/08/2002	En route	White Waltham	10nm NW	EGTT : London (FIR)	BOLKOW	Turboshaft	2	Nr2 engine chip detector warning. 'Chip pulse' switch activated for 15 seconds but warning persisted. Engine shut down, uneventful single engine run on landing carried out.	Fine metallic debris found on lower magnetic plug. Aircraft ground run for 30 minutes - no further indication of defect.

200206116	27/08/2002	En route	ORTAC		EGTT : London (FIR)	BOEING	Turbofan	2	Nr1 engine shut down due to high vibration and failure indications. PAN declared, aircraft returned.	During take-off and initial climb, nr1 engine vibration indicator read 2-2.5 units. All other indications were normal with nr2 engine vibration indicator reading approx 1 unit. As power was reduced at level offs during climb, nr1 vibration fell to approx 1 unit but when climb power was restored it returned to 2.5 units, increasing to 3 units as altitude increased. No airframe vibration was present at any time. As a precaution QRH high engine vibration checklist was reviewed and tech log checked. Vibration increased to 4/5 units at 28500ft with loss of thrust and a banging noise. PAN declared, return initiated and engine failure/shutdown checklist actioned on nr1. Fuel burnt off in hold to reduce to max landing weight. Single engine landing carried out satisfactorily with AFS in attendance and normal disembarkation carried out. Engine teardown inspection revealed a failed No 4 bearing, the cause of the failure was to be determined by the overhaul agency and operator. □ CAA Closure: The hazard is acceptable provided the frequencyremains low.
200206272	03/09/2002	En route	Oxford	6nm W	EGTT : London (FIR)	AGUSTA	Turboshaft	2	Nr1 engine low warning - NG fell to zero. MAYDAY declared(later downgraded to PAN). Engine shutdown. Single enginelanding carried out with AFS in attendance.	Investigation found electrical connector detached from nr1 engine NG tachometer. Connector resecured and ground test carried out with satisfactory results. All other enginetacho generator connectors checked and found secure.
200206274	02/09/2002	En route	East Midlands		EGTT : London (FIR)	BOLKOW	Turboshaft	2	Nr2 engine mag plug illuminated in flight. Engine shut down and run on landing carried out.	Upper and lower magnetic chip detectors examined, revealing fine metallic debris. Oil filter replaced, oil system drained and refilled, 30 minute ground run carried out withno further defects reported.
200206574	09/09/2002	Approach	Manchester (MCT)		EGTT : London (FIR)	BAE	Turboprop	2	LH engine flame out during approach. Failure of the fuel bypass valve connector 1KR15P.	At approx 500ft agl on an ILS approach to R/W06, with P2 handling, the LH engine flamed out, rapidly winding down and causing the aircraft to lose airspeed and height. Full power was required on the RH engine to regain the glideslope but this produced an almost uncontrollable yaw and rollo to the left. The P1 assisted with the controls to add authority to the rudder and aileron. Once under control, it was discovered that the aircraft's position was not suitable to afford a safe landing (i.e. left of the centreline and too high). A MAYDAY was declared and a LH circuit flown with the LH engine shut down and the propeller feathered. The subsequent landing was uneventful. Engine ground run revealed that, with TTL in 'ON' position, once the power lever was advanced past the TTL inhibit microswitch, there was an increase in EGT while RPM and fuel flow decreased. Engineering investigation revealed low insulation resistance at fuel bypass valve connector 1KR15P and potting compound breaking up. New connectors fitted on both left and right hand engines. The operator's maintenance organisation have also instigated a programme to change these connectorsacross their fleet at the next scheduled hangar maintenance visit. In addition, they have also introduced a function check of the Continuous Ignition System at each ServiceCheck (Every 8 Days).□ CAA Closure: The hazard is adequately controlled by the actions stated above.
200206643	16/09/2002	En route	Wokingham (Berkshire)		EGTT : London (FIR)	BOLKOW	Turboshaft	2	Nr2 engine in-flight shut down due to "Mag Plug" warning.Aircraft returned. Magnetic plugs contaminated. Recurringfault.	At 1000ft QNH during cruise, nr2 engine "Mag Plug" light illuminated. The chip pulse switch was activated and the warning light extinguished. However, a few seconds later the light re-illuminated and the nr2 engine was shut down law the emergency checklist. The aircraft then returned to departure airfield and an uneventful single engine landing was carried out. The reporter confirms that both magnetic plugs were heavily contaminated and that this is the thirdchip detector warning on this aircraft within 50 hours ofoperation - see also 200206021. The Engine was returned to an Engine Overhaul Facility for investigation. The engine has subsequently been released to service.□ CAA Closure:The hazard is adequately controlled by existing requirements, procedures and documentation.
200206705	15/09/2002	En route	Farnborough	15 N W	EGTT : London (FIR)	DE HAVILLAND	Reciprocating	2	LH engine ran roughly, engine shutdown and PAN declared, later upgraded to MAYDAY. Aircraft diverted and landed safely with AFS in attendance.	Pilot reported rough running LH engine and requested immediate diversion to Farnborough. Aircraft placed under a limited RAS (due SSR only) and vectored towards Farnborough for left base R/W06. Initially pilot declared PAN then upgraded to MAYDAY.
200206755	18/09/2002	En route	Honiley (HON)	45 SE	EGTT : London (FIR)	FOKKER	Turboprop	2	LH engine gearbox oil pressure warning so engine shutdownand aircraft diverted to Birmingham where it landed safely with AFS in attendance.	Reporter states that this was second sector; the first sector GLA-MAN indicated no problems and that walkround inspection at MAN showed no abnormalities. See also 200001859 and 200108052.
200206763	19/09/2002	En route	Norwich		EGTT : London (FIR)	SIKORSKY	Turboshaft	2	Nr1 engine chip warning. Checklist actioned, engine shutdown.	During the go-around from the NDB/DME 09 procedure at Norwich, the nr1 engine chip warning illuminated. Procedure 2/9 of EOPs carried out. Recycling of the c/b cleared thewarning but within 10 seconds the warning recurred. The engine was shutdown and a single engine landing carried outat Norwich without further incident.□ The flight was a training trip to carry out an LPC. Small amount of debris was found on the forward magnetic plug during the 800hr inspection. Oil change carried out and accessory gearbox flushed. SOAP check and debris sent for analysis. Aircraft released for training. On return, magnetic plug inspected and found to have excessive amount of debris. Engine removed from service.
200207440	12/10/2002	En route	Ockham (OCK)		EGTT : London (FIR)	OTHER	Unknown		PAN declared by military transport aircraft due precautionary engine shutdown.	
200207538	16/10/2002	En route	Stapleford		EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	2	RH engine chip caption illuminated on CWP. Engine shutdown. PAN declared. Pilot stated he would return to base but then elected to divert to Stapleford.	Small 'hair like' sliver found on upper mag plug. Both detectors cleaned and refitted, high power ground run carried out and detectors again removed/inspected satisfactory.CAA Closure: The hazard is acceptable provided the frequency remains low.
200207745	23/10/2002	En route	Willingale		EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	2	RH engine chip caption illuminated. PAN declared. Engine shutdown. Diverted.	Light fuzz found on upper accessory gearbox plug. Turbinemodule changed and despatched for repair. Ground run carried out and detectors again removed/inspected satisfactory. Investigation being progressed under 200207538.
200207929	30/10/2002	Approach	Exeter	3 S	EGTT : London (FIR)	SHORT	Turboprop	2	RH engine fire warning occurred during training flight. Engine shutdown - fumes on flight deck. Landed safely with AFS in attendance.	During LPC/OPC with LH engine simulated failed and passing 1200ft in simulated emergency turn, RH engine fire warning sounded. Power restored to LH engine and aircraft rolled out on heading 180°, fire bell cancelled and engine firedrill completed - RH engine. PAN call made to ATC and radar vectored ILS to Runway 26 flown. Aircraft stopped on runway, shut down and crew vacated. During "subsequent actions" to engine fire drill - shedding bus to "over-ride" didnot restore power to shedding bus. Situation assessed andpower restored to shedding bus by selecting "emergency". Also after landing, considerable quantity of oil observed dripping from engine nacelle and covering right hand tailplane. This defect was caused by a combination of three things: 1. The fire detection wire and engine wiring harness were routed incorrectly bringing them close to the gas generator case exhaust stack joint. 2. The exhaust stack joint and gas generator case joint was assembled incorrectly allowing the joint to separate slightly passing hot gas on to the fire wire and electrical wiring harness. The combination of the two items above resulted in a strong hot flowof gas being directed on to the fire detection wire, thiscorrectly detected this as a fire and set off fire indications. The exhaust stack has been replaced and assembled correctly with the gas generator case. The fire wire has been replaced and routed correctly: no further reoccurrences of this defect have been reported. Engineering Manager has raised a Quality Bulletin to re-emphasize to Engineers the requirement to follow approved data and additionally to draw attention to the incorrect installation. Copy of the QAB has also been sent to the maintenance organisationwho had replaced the said engine in July 2001. The shedding bus defect was investigated and the R/H Generator slaverelay terminal 22 wire had a poor connection: the wire was remade and function tested satisfactory. There has not been any further re-occurrence of this defect.□ CAA Closure: The hazard is adequately controlled by the actions stated above.
200207966	31/10/2002	En route	Basildon		EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	2	RH engine chip caption illuminated. Engine shutdown. PAN declared. Aircraft returned.	Swarf particles found on mag plug. Reporter states suspect particles from recently changed turbine module - 200207745 refers. Investigation being progressed under 200207538.
200207991	04/11/2002	En route	Dartmouth (Devon)	Newcott Farm	EGTT : London (FIR)	ROCKWELL	Reciprocating	1	UK Reportable Accident : Engine lost power then seized due to oil loss. Aircraft destroyed during forced landing. No injury to 2 POB. AAIB AARF investigation.	Some 15 minutes into the flight, the pilot noticed a slight reduction in engine power. Almost immediately, a significant amount of blue smoke entered the cabin. As the visibility reduced, the pilot elected to make a forced landing,but before he could shut the engine down, it seized. Following this, the smoke dissipated but the aircraft sufferedextensive damage as it landed in a field. Examination of the aircraft revealed clear evidence of loss of engine oilin flight, but despite a detailed strip examination of the engine, the origin of the leak was not established. Prior to flight, the pilot had checked the oil level and between 7 and 8 quarts were indicated on the dipstick. See AAIBBulletin 4/2003, ref: EW/G2002/11/03.□ CAA Closure: The hazard is acceptable provided the frequency of occurrence remains low.
200208087	20/10/2002	En route	Wyton		EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	2	RH engine chip caption illuminated. Engine shutdown. Diverted to Wyton.	Hair' like sliver found on upper accessory gearbox plug.Detectors cleaned and function checked. Engine ground runcarried out and detectors again removed/inspected satisfactory. Investigation being progressed under 200207538.

200208221	14/11/2002	En route	Leeds Bradford (LBA)		EGTT : London (FIR)	BAE	Turboprop	2	Nr1 engine low oil pressure warning. Engine shutdown, PANdeclared and the aircraft diverted to Manchester .	Passing FL155 in IMC and moderate rain a CAP 'L OIL PRESS' warning occurred with Engine 1 oil pressure indication fluctuating and then falling below 35 psi. EAP Card 6-13 was actioned and Engine 1 was shut down. A PAN was declared to ATC and a diversion was made. Commander made a PA to passengers with no cabin concerns reported. The single engine manually flown approach and landing were made uneventfully to Runway 06R and the aircraft was stopped clear of therunway for AFS inspection. The aircraft was shutdown and passengers were disembarked to a coach. Engineering Investigation found masking tape covering the main oil system drain mast, which was removed and following engine ground runs, no faults were found. It is noted that aircraft had returned to service 300902, following a re-paint by sub-contracted company. Engineering note that the blockage of the vent resulted in the gradual loss of efficiency within theoil pumping and scavenging systems and eventually the lowoil pressure warning recorded in this event. Flight Operations Review has concluded that the fault was located in an area not normally checked by Flight Crew. Crew actions were correct, procedures are satisfactory and no action is required or intended. Cabin Services Review, including crew de-brief, intends no action. Initial Engineering Review,whilst noting that the requirements of ETR TS6164 under which the repaint was carried out includes the requirement to remove all masking tape, has amended / re-issued Company repaint process sheet MAN/TS/018 150103.□ CAA Closure: The hazard is adequately controlled by the actions stated above.
200208324	14/11/2002	En route	London-Gatwick - LGW		EGTT : London (FIR)	ATR	Turboprop	2	PAN declared with one engine shut down. Aircraft returned.	The oil pressure transmitter was replaced iaw 79-30-00. No further reports since 14 Nov 2003.□ CAA Closure: The hazard is acceptable provided the frequency remains low.
200208423	14/11/2002	Take-off	London-Gatwick - LGW		EGTT : London (FIR)	ATR	Turboprop	2	Nr1 engine low oil pressure warning. PAN declared, engineshutdown and aircraft returned.	During climb nr1 engine low oil pressure light illuminated with associated gauge showing just above zero. Engine shut down iaw QRH, PAN declared and aircraft returned. Only fault found was contamination of oil low pressure transmitter with oil deposits. Engine run carried out before and after cleaning of transmitter - all indications normal. Transmitter replaced as precaution.
200208430	19/11/2002	En route	North Sea		EGTT : London (FIR)	SIKORSKY	Turboshaft	2	Nr2 engine chip warning. Engine shutdown. Diverted to Norwich.	A one-hour ground run was carried out at power and magnetic plugs inspected with no significant findings. Reporter states that the aircraft had experienced two chip captionson the nr2 engine the previous day. The first occurred onlanding at North Denes. Appropriate actions were taken and all magnetic plugs associated with the engine were inspected - a minute quantity of ferrous dust, well within the manufacturers limits, was found on one plug. The second caption occurred in flight and the aircraft routed to Norwich where all magnetic plugs were inspected, in addition to this the oil filter was removed and inspected and the engine oil system flushed. Only a single fine metallic sliver was found on one magnetic plug, again within the manufacturers limits. A 30-minute ground run at power was carried out and all magnetic plugs re-inspected, no further particles were found and aircraft was cleared for return to base.Magnetic plugs were inspected again post shutdown and found to be clean. Reporter cites that it should be noted that this engine was fitted approximately 40 flight hours agoand the collection of some build debris by these magneticiplugs is acceptable within the engine manufacturers maintenance criteria within the first few hours of operation.
200208465	22/11/2002	En route	London (LON)	Overhead	EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	2	RH engine shut down due to chip warning. PAN declared. Diversion.	RH engine chip warning illuminated at 1300ft during cruise. A PAN was declared and the engine was shut down iaw emergency procedures. The aircraft then diverted to Stapleford Aerodrome and an uneventful landing was carried out. Investigation revealed substantial quantities of 'spall' or flattened machined particles on the reduction gearbox chip detector and moderate contamination of the NTL detector, engine oil reservoir mag plug and engine oil filter. Engineand oil cooler replaced, manufacturer informed and strip inspection requested.
200208478	22/11/2002	En route	Maldon (Essex)		EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	2	RH engine shut down due to chip warning. PAN declared. Chip detector contaminated.	At 1000ft during cruise, the RH engine chip light illuminated on the CWP. Faulty engine confirmed and shut down iawFlight Reference Card (FRC). A PAN was declared and a single engine recovery made to base. Subsequent investigationrevealed a minute sliver on the upper chip detector. Serviceability check carried out iaw the engine manufacturer'smaintenance manual and aircraft returned to service. The reporter confirms that this aircraft had flown 11 hours and 35 minutes since a turbine module change. Investigation being progressed under 200207538.
200208508	24/11/2002	En route	Halesworth		EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	2	LH engine chip caption illuminated on CWP. Engine shutdown. PAN call. Diverted to Wattisham.	Engineering inspection found mag plugs contaminated with debris in excess of permitted limits. Engine removed for further investigation.
200208514	22/11/2002	Take-off	Coventry		EGTT : London (FIR)	CESSNA	Reciprocating	2	Hydraulic leak observed from RH engine following low flowwarning. Engine shut down. MAYDAY call. Emergency gear extension carried out. Aircraft returned and landed safely with AFS in attendance.	The aircraft departed for a test flight following a maintenance check. After setting climb power, the left and right hydraulic 'low flow' warning lights illuminated. Landinggear was selected down and, after a short delay, the indications showed left and right main gear down and locked but the nose gear light remained off with the gear unlocked light illuminated. Shortly afterwards fluid and smoke was observed coming from the RH engine, which was shut down iaw relevant checklist. Landing gear recycled but indications did not change although warning annunciator panel press-to-test showed the nose gear light to be serviceable. Emergency gear blow-down operated and normal down and locked indications obtained for all three landing gears. MAYDAY declared and priority landing clearance given. Uneventful flapless landing carried out with AFS in attendance. Investigation traced fault to the RH hydraulic flexible pressure hose from the engine driven pump (EDP), which had failed internally approx 1.5" from the straight connection end fitting of the EDP. The fire sleeve installed over the flexible hose was also damaged by the force of failure. A new hose was fitted and full landing gear retraction and flap operation checks were carried out with satisfactory results.Following a review of the maintenance schedule and discussions with the operator, it was decided to place a life limitation of six years on these hoses.
200208838	29/11/2002	Approach	Stapleford		EGTT : London (FIR)	PIPER	Reciprocating	2	RH engine power loss due to fuel starvation. Fuel loss/venting from tank due to fuel cap insecurity.	During circuit to land, the RH engine "Fuel flow warning"light illuminated. With the emergency fuel pump on, the fuel selector was switched to the outer fuel tank. This action did not restore fuel pressure but subsequently caused the RH engine to lose power. Appropriate actions were carried out iaw company SOPs and the RH engine was closed and secured. An uneventful single-engine approach and landing was carried out. Subsequent investigation revealed that the fuel filler cap was insecure which resulted in fuel being vented overboard. Crew briefed and appropriate operatinginstructions will be issued to prevent a recurrence.
200209212	16/12/2002	En route	Codnor		EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	2	RH engine chip warning illuminated in flight.	Shortly after take off, the RH engine chip warning light began to flicker. Relevant checks were completed but the engine was not shut down. The aircraft returned and landed safely. Inspection of the chip plug found a very small splinter - plug cleaned and aircraft returned to service. However, a similar incident occurred on the following day andon this occasion the engine was shut down before the aircraft returned. Further investigation revealed that the bayonet connection for the chip plug and self-sealing assembly was worn, allowing movement of the detector which triggered the spurious warnings - assembly replaced.
200300025	02/01/2003	En route	Compton (CPT)		EGTT : London (FIR)	BOEING	Turbofan	2	PAN declared due engine failure/shutdown. Direct routing given.	
200300141	10/01/2003	En route	Anglia Radar		EGTT : London (FIR)	SIKORSKY	Turboshaft	2	Nr2 engine chip warning illuminated. Engine shutdown. PANdeclared. Flight continued without further incident.	Oil filter removed, cleaned and refitted. 30 minute hovercheck carried out - no debris found.
200300292	17/01/2003	En route	Exeter		EGTT : London (FIR)	BOLKOW	Turboshaft	2	PAN declared due to one engine being shut down. Aerodromefull emergency (limited response) initiated. Aircraft landed safely with AFS in attendance.	
200300525	28/01/2003	En route	Manchester (MCT)		EGTT : London (FIR)	BOEING	Turbofan	2	Nr2 engine overheat warning in cruise. Engine shut down. PAN declared and the aircraft diverted to Manchester .	In the cruise at FL360, the nr2 engine overheat light illuminated. Engine overheat checklist carried out, but the light remained illuminated until the thrust lever was fullyretarded and then it went out. A few seconds later the nr2 engine overheat light began to illuminate intermittently. Engine fire checklist actioned, and after one fire bottle had been discharged the engine overheat light went out and remained out. 'One engine inoperative' landing checklist carried out and aircraft diverted to Manchester, having declared a PAN. Engine CFM56-7B s.n. 857426 removed for shop visit following overheat occurrence. Engine failure investigated by GE Engine services under order number B30186dated 18 Feb 2003 and copy of the report submitted on 27Jul 2003. Two Potential causes of the Engine overheat were identified as follows:- 1. Hot Air leaks from P54/T54 worn gaskets, 2. Defective D3302 Airframe connector. Appropriate corrective actions have been put in place by the operator and overhaul agency to prevent re-occurrence.□ CAA Closure: The hazard is adequately controlled by the actions stated above.
200300601	30/01/2003	En route	Manchester (MCT)		EGTT : London (FIR)	CONVAIR	Turboprop	2	Emergency declared due to 'failed' RH engine. Aircraft diverted to Manchester.	
200300622	31/01/2003	En route	IATCC - DVR Sector		EGTT : London (FIR)	LOCKHEED	Turbofan	3	Nr 3 engine failed. Aircraft diverted to Manston where a full emergency declared. Aircraft landed safely.	

200300652	04/02/2003	En route	En Route		EGTT : London (FIR)	EUROCOPTER	Turboshaft	2	Rotor speed indicator (NR) decrease during flight. Diversion. Nr2 engine oil pressure warning on landing.	During return to base the NR indicator fell to zero with no associated audio or warning captions therefore the aircraft diverted to the nearest airport. Upon landing, when the nr2 engine was selected to idle the master caution illuminated along with an engine oil pressure CDS caption. Theoil pressure gauge dropped into the red (but did not reach zero) and the engine was shut down. The reporter confirms that the engine had been fitted only 5 days earlier and that this is a common occurrence on this aircraft - see also 200300013 and 200300507. NR probe plug disconnected, contacts cleaned and plug refitted. Ground run and function checks carried out with satisfactory results - probe to bereplaced on receipt of spare. On the manufacturer's advice a ground run was carried out to ensure positive pressureindication and a ground idle setting at N1 of greater than 65% - both of these were confirmed. It is suspected thatwhen the engine was retarded to ground idle, a slight underswing in oil pressure was responsible for illumination of the caption. The pressure switch is to be replaced as a precaution. N2 Rotor Rpm probe plug cleaned.□ CAA Closure:The Hazard is adequately controlled by existing requirements, procedures and documentation.
200300789	28/01/2003	En route			EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	2	Both engine chip lights illuminated on different occasions during flight. PAN declared.	Shortly after take off the LH engine chip light illuminated. FCL retarded to flight idle, PAN declared and return initiated. Passing 1000ft, prior to engine shut down, the light extinguished. As the aircraft was post major inspection, it was concluded that the indication was caused by minor swarf and the flight continued. Approx 20 minutes laterthe RH engine chip light illuminated. The engine was shutdown and the aircraft diverted to Denham for an uneventful run-on landing. All 4 magnetic plugs were inspected, revealing some swarf containing very minor metallic particles. The aircraft was assessed as serviceable and the task completed without further incident. Subsequent investigationdetermined that the RH engine had recently been changed and that the 'loan' engine had suffered oil cooler debris build up from the previous engine fit. Oil coolers flushed and refitted. No further similar problems reported.
200300799	06/02/2003	Take-off	Stansted		EGTT : London (FIR)	BAE	Turbofan	4	RTO at approx 50kts due to nr3 engine power loss.	During take-off roll nr3 engine N1 failed to increase above 12.1%, therefore take-off was abandoned at approx 50kts. TGT was noted at 868deg C so the engine was shut down and the fuel cut-off handle was pulled as a precautionary measure. Nr3 engine was visually checked during taxi to stand and nothing abnormal noted.
200300881	12/02/2003	En route			EGTT : London (FIR)	LOCKHEED	Turboprop	4	PAN declared with nr3 engine shutdown. Aircraft returned.	
200301022	15/02/2003	En route	Manchester Barton A/F		EGTT : London (FIR)	OTHER	Reciprocating	1	Engine failed during climb. MAYDAY declared and aircraft returned. Engine regained some power prior to a safe landing. RFFS deployed.	
200301102	23/02/2003	En route	Monk Sherbourne (Hampshire)	Nr Basingstoke	EGTT : London (FIR)	GRUMMAN	Reciprocating	1	MAYDAY declared due to engine failure. Aircraft safely forced landed in a field. No injuries to 2 POB. D & D alerted.	
200301274	27/02/2003	En route	Wallasey (WAL)	20nm NW	EGTT : London (FIR)	BRITTEN NORMAN	Turboprop	2	Nr2 engine failure/shutdown. Aircraft diverted to Isle ofMan.	
200302293	17/04/2003	En route	Powsey (Wiltshire)	Bromsgrove Farm	EGTT : London (FIR)	DE HAVILLAND	Reciprocating	1	UK Reportable Accident : Engine failure. Aircraft landed at a steep angle in a field. Propeller and landing gear damage. No injury to 1 POB. AAIB AARF investigation.	AAIB Bulletin 11/2003, ref: EW/G2003/04/12 - Summary: Whilst cruising at approximately 2,000 feet the pilot noticeda slight engine vibration which, within a few seconds, worsened and the engine lost power. A backfire was heard andthe pilot saw smoke coming from the carburettor air intake. The vibration increased when the throttle was opened. The pilot checked both the magnetos and fuel supply, with no anomalies noted, before conducting a forced landing intowind. During the landing roll, however, the aircraft tipped onto its nose coming to rest on the propeller and left wing tip. The pilot, who was uninjured, was able to climb out of the open cockpit. There was no fire. Examination of the engine by a maintenance organisation revealed that the nr2 cylinder inlet rocker arm had failed close to the exhaust valve, with the separated portion having become jammed in the exhaust guide. The broken pieces of the rocker arm, which were returned to AAIB for metallurgical examination, revealed a high cycle fatigue failure which had initiated in a region of mechanical damage. The aircraft, fitted with this engine, had been operated by the current owner for some 30 years with low utilisation. The engine had completed 670 hours since overhaul, but only 170 hours since 1978. The last entry in the log book for maintenance, which would have entailed removal of the cylinders and thus the rocker arm, was in 1990. It was not possible to determine when or how the damage to the rocker arm occurred.□ CAA Closure - No CAA action appropriate.
200302363	16/04/2003	En route	Northwood		EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	2	ECU oil pressure malfunction.	Nr1 engine oil pressure started to fluctuate, initially between 7.0 to 7.8 bar, with the indications progressively becoming more extensive and lower. As engine torque, NG, T4 and oil temperature were steady and normal, the flight continued. When 3 nm north of the destination, nr1 torque fluctuated between 65% and 70%, a PAN was therefore declared and the engine shutdown. The aircraft landed at Northoltwithout further incident. Investigation included a static pressure check on the oil pump revealing a leak between pump bodies. Dis-assembly of the oil pump found that therehad been fretting of two pump bodies. The pump body was found to have gear pockets oversize and the scavenge body pick up tube was part worn.
200302418	23/04/2003	En route	East Midlands	3nm SE EMA	EGTT : London (FIR)	SHORT	Turboprop	2	LH engine failure. MAYDAY declared. Aircraft returned. Nr1 bearing failure.	About 8 minutes after take-off, the LH engine failed withno fire warnings, but with a physical thump and fireball observed. The LH engine was shut down, but no fire extinguisher was discharged as there was no fire warning. The crew carried out engine shut down in accordance with Checklist, MAYDAY declared. Aircraft returned and single engine landing carried out on R/W 09 with vectors. RTOP and auto feather functioned before the crew shut down the engine. Initial investigation by the operator showed that the compressor section of the engine had seized and would not rotate,which indicates the failure of the Nr1 bearing. This was further confirmed when the engine oil filter and gearbox chip detectors were inspected, both showing metal and carbon contamination, indicating bearing and carbon seal failure. An engine change was subsequently carried out. The failed engine has been returned to the manufacturer for inspection and repair. It is a possibility that a starter generator failure on this aircraft could have contributed to the problem. This had been previously promulgated as a possible problem by the aircraft manufacturer under SIL Number SD360-IL-207 originally issued August 2000. A fleet inspection has been carried out to check the airframe enginebonding and the starter generator bonding. The engine strip report confirms nr1 bearing failure, which was investigated by the OEM. They concluded there was no evidence of any original material or manufacturing defect, with the condition, in their opinion, being caused by a recent event involving the starter / generator. See also 200302134 and 200303813. □ CAA Closure: The hazard is adequately controlled by the actions stated above.
200302476	25/04/2003	En route	Blackpool (BPL)	10nm N	EGTT : London (FIR)	HAWKER SIDDELEY	Turboprop	2	Nr2 engine failed to unfeather. The aircraft diverted.	Whilst carrying out an engine shut down and relight drill, the RH engine propeller failed to unfeather during the attempted relight. Aircraft diverted to the engineering base at Blackpool. The following maintenance actions were carried out: CBs checked and found satisfactory. Electrical plugs to PCU solenoids checked, cleaned and wire locked. Prop functional checks carried out iaw EA/TR/121, checked out satisfactory. The aircraft was released to service. Following this MOR a feather snap check has been introduced. Series 1 aircraft at each A Check, Series 2 aircraft at each B Check. No further occurrences. □ CAA Closure: The hazard is acceptable provided the frequency remains low.
200302608	30/04/2003	En route	Boreham, Essex		EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	2	LH engine spurious fire warning.	Two minutes after take off the LH engine fire caption illuminated. There were no signs of fire but a PAN was declared and the FFC was retarded to ground idle to check for a hot gas leak. The caption remained illuminated so the engine was shut down, at which point the caption extinguished.An uneventful single engine landing was then carried out.No fault was found during the subsequent inspection and the warning was attributed to prolonged heavy rainfall prior to departure.
200302763	08/05/2003	En route	DIKAS		EGTT : London (FIR)	BOEING	Turbofan	2	Nr2 engine shut down. Emergency squawk selected. Expeditious routing provided.	
200302917	25/04/2003	En route	En Route		EGTT : London (FIR)	BOEING	Turbofan	4	Nr3 engine inflight shutdown due to a low oil pressure warning.	During descent at idle power, EICAS caution "ENG 3 OIL PRESSURE" was displayed. The ORH was actioned and the nr3 engine was shut down. ATC were informed and a 3-engine landing carried out. After replacement of the oil pressure transmitter and low oil pressure warning switch, the engine still experienced low oil pressure on a check start. ADD raised for engine change and nr3 engine s/n 13372, tag M24851J was removed.
200302945	09/05/2003	En route			EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	2	Nr1 engine chip warning illuminated in flight - engine shutdown. Aircraft diverted to Denham and landed safely.	Engine removed for detailed strip inspection and repair.
200302959	13/05/2003	En route	North Sea		EGTT : London (FIR)	SIKORSKY	Turboshaft	2	Aircraft diverted to Humberside with one engine shut down. PAN declared. Engine bearing(s) failed.	10 minutes prior to landing on the Waveney the nr2 engineschip light illuminated. Nr2 engine chip CB was pulled andreset I.A.W checklist actions. The light extinguished andflight continued. Approx 5 minutes after t/o from the Waveney the light illuminated again. It did not extinguish. The nr2 engine was shutdown i.a.w. the checklist actions and the aircraft returned to base. Engineers reported 'Type 3' debris (shiny flakes) on Magnetic Plug + Return Magnetic Plug. Oil change carried out. Following 15 min ground run more debris on Magnetic Plugs. Following consultation with Turbomeca Modules 4 & 5 rejected. (Modules 4 & 5 share oil scavenging). Following strip and inspection evidence of metal contamination found on matched bearing set p/n 9609000254 in Module 5. Further investigation found severe flaking around diameter of No 3 bearing inner race. Copies of strip and rectification reports submitted in support of these findings. See also 200302888. □ CAA Closure: Hazard is acceptable provided the frequency remains low.

200302985	14/05/2003	En route	Norwich	1.5nm NW	EGTT : London (FIR)	SIKORSKY	Turboshaft	2	Nr1 engine shut down due to chip warning. Aircraft returned. MPIL oil filter contaminated.	The aircraft had just levelled at 2000ft after departure when nr1 engine chip warning illuminated. Emergency checklist procedure carried out but caption did not clear, therefore nr1 engine was shut down and an uneventful single engine landing carried out on R/W 27 at Norwich. All chip detectors and mag plugs were inspected and a small sliver found on the MPIL oil filter. Filter inspected and cleaned with nothing else evident. Oil system drained/replenished and leak check/heavy hover carried out. Further inspection of chip detectors carried out with no contamination evident. Aircraft returned to service. Engine TSN 7011, TSO 510.50.
200302992	21/04/2003	Approach	East Midlands		EGTT : London (FIR)	BAE	Turboprop	2	Engine shut down during approach due to restricted torquemanagement.	When the power levers were retarded fully during approach, the LH engine was still producing 25-30% torque. A missed approach was carried out. After failing to equalise the engines, the LH engine was shut down prior to a single engine landing. When checking the torque indication DSC settings on the torque signal conditioner during subsequent engineering investigation, the lock nut on the adjuster was found to have detached from the potentiometer. The potentiometer had recessed into the conditioner and when moved, caused uncontrolled movement of the torque indications. The conditioner was replaced, with no recurrence after 39hrs /51 flights. The operator is initiating a fleet check. Seealso 200305022.
200303638	10/06/2003	En route	East Midlands	Nr	EGTT : London (FIR)	EMBRAER	Turbofan	2	Nr1 engine oil loss with low pressure, and temperature increasing - precautionary engine shutdown. PAN declared. Diverted to East Midlands.	Whilst accelerating through MACH 0.69 at FL290, the oil quantity on the nr1 engine was seen to be 3 qts, with the oil pressure decreasing and the temperature increasing. The flight crew elected to carry out a precautionary landingat East Midlands. A PAN was declared, the cabin crew were briefed and the passengers informed. Oil pressure and temperature were monitored and they continued to decrease/increase respectively. When the pressure had fallen to 61 psi the engine was shutdown in accordance with the QRH. The cabin crew were again briefed, the passengers informed andthe PAN was then upgraded to a MAYDAY. Extended vectors were taken from ATC whilst the QRH, checklist and briefingswere actioned. A normal single engine, overweight (250kgs) landing at East Midlands was carried out. Aircraft taxied onto stand where the passengers disembarked normally. The nr1 engine has a modification which introduces a cool-air buffered centre sump. Typically this causes the engine to run at a higher oil temp and a lower oil pressure than a pre-mod engine. It is typical that the engine oil quantity is lower than pre-mod engine, hence the lack of a EICASwarning. The engine manufacturers have issued an OperatorInformation Letter (WW/30040/1/9) which address this. Theoperator has raised a Flight crew notice to advise their crews.□ CAA Closure: The hazard is adequately controlled by the actions stated above.
200303670	11/06/2003	En route	Norwich	10 E	EGTT : London (FIR)	LOCKHEED	Turboprop	4	Nr4 engine propeller overspeed. Engine shutdown. PAN declared. Diverted to Norwich, Propeller hydraulic pump internal regulator failed.	Nr4 engine rpm stabilised at 14600 rpm and failed to reduce to the expected governed speed of 13820 rpm following engine relight during C of A test flight. Horsepower indication cycled slowly between negative 120 and positive 5700. Small power lever movements which were carried out to ascertain if the propeller was pitch locked were inconclusive, as the engine rpm remained constant, with the fluctuating horsepower indications that did not relate to power lever movement. The propeller overspeed drill from the checklist was called for, but prior to commencing the checklist the rpm increased rapidly beyond the maximum reading of the gauge (16000 rpm). The propeller was assumed to have de-coupled, and after a wait of approximately 5 seconds to ascertain if it would re-couple, thereby reducing the rpm, the emergency shutdown handle was pulled and the propeller feathered. A PAN was declared and the aircraft diverted toNorwich. A complete Quick Engine Change (QEC) was carriedout and the propeller assembly dispatched to overhaul agency for overspeed inspections and strip examination to determine the initial cause. The engine and gearbox were dispatched to overhaul agency for overspeed inspections. Reporter states that in the meantime crew training will avoid in-flight engine shutdown and restarting practices until a cause of the overspeed has been determined. Dynamic test of the regulator assembly simulates normal flight conditions. The test found that the internal regulator hydraulic pumps were producing a reduced flow due to internal leakage.No further attributable defects were found. This reduced flow rate and would have had a detrimental effect upon thecapacity of the propeller governor to 'catch' the rpm during an in-flight start where the propeller and engine acceleration is rapid. It would also cause associated components within the propeller system to function at a reduced rate thereby possibly causing an overspeed condition. The incident regulator was a particularly high time unit, 8,556 hrs of the 10,000 hr overhaul life. The operator has carried out a fleet review of the internal regulators fitted totheir aircraft and found only five regulators with a TSO in excess of the 3,750hrs. The operator has now introduceda flow check of the internal regulator when they reach 3,750 hrs TSO. The results of this check will be used to establish a periodicity for future flow checks. For those regulators that have exceeded 3,750 hrs TSO, they intend to remove each one at the next scheduled maintenance check andsend them away to the overhaul agency for a flow check. The overhaul agency has also identified a list of 'best practice' maintenance items that in their experience can attribute to wear problems with respect to the regulator.□ CAAClosure: Hazard adequately controlled by the actions stated above.
200303747	13/06/2003	En route	Scampton (Lincolnshire)		EGTT : London (FIR)	AGUSTA	Turboshaft	2	Engine malfunction. Engine shut down and aircraft diverted. Compressor Foreign Object Damage (FOD).	A sudden loss of power occurred on nr2 engine, indicated by a 'torque split'. The 'torque split' was contained and power restored but with a residual indication of unstable turbine outlet temperature and vibration. The engine was shut down and the aircraft diverted to RAF Waddington. Engine removed for inspection, intake/compressor FOD found. Severe damage to several stages of compressor stator and rotor blades. No evidence of the 'Foreign Object' remained in compressor. Engine Turbine/induction section inspected with nil further findings. Internal procedures include the use of proseal and anti-sabotage paint on bolts/screws to retain potential loose article in the intake area. All staff have been re-briefed regarding the importance of engineintake security, and the effects of FOD.□ CAA Closure: The hazard is acceptable provided the frequency remains low.
200303981	21/06/2003	En route	Wickenby		EGTT : London (FIR)	CESSNA	Reciprocating	1	Engine failure. Aircraft diverted and landed safely.	Having requesting a FIS, the pilot reported a severe vibration and required somewhere to land. The aircraft was instructed to squawk 7700 while D & D were informed. The aircraft diverted to Wickenby where it landed safely. The pilot subsequently reported he had suffered a total engine failure.
200304079	26/06/2003	Take-off	Sheffield		EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	2	Nr1 engine chip light warning due to contamination of magnetic plugs.	Nr1 engine chip light illuminated on reaching flight Idleduring take-off therefore the engine was shut down. The magnetic plugs were then inspected and debris in excess of limits was found on both plugs. Engine removed for diagnosis and repair. Total aircraft hours 9654.50.
200304084	27/06/2003	En route	En Route		EGTT : London (FIR)	PIPER	Reciprocating	2	MAYDAY declared and LH engine shut down due to low oil pressure. Aircraft returned. Gauges detached from their mounting.	Uneventful landing. The pilot reported that the engine oil pressure and temperature had increased into the red on the left hand engine during flight and elected to shut downand declare a mayday. The aircraft was inspected at Blackbushe by an LAE and the left engine oil pressure relief valve was removed and inspected. No faults were evident and the valve was refitted. Upon inspection of the gauges it was clear that they had become detached from their mountingallowing the gauges to move and the needles to be displaced by contact with the gauge glass front. The gauges were removed from the aircraft and a fastener that secures the gauges was found to have a loose formed head, allowing thegauges to displace. The gauges were re-aligned and the fastener re-swaged. After refitting of the gauges, a calibration check was carried out using a digital pressure gauge.The engine was found to be within limits and the cockpit gauge was found to be accurate. Occurrence considered as an isolated incident.□ CAA Closure: The hazard is acceptable provided the frequency remains low.
200304220	30/06/2003	En route	COWLY		EGTT : London (FIR)	MCDONNELL DOUGLAS	Turbofan	3	The nr3 thrust reverser light came ON in flight. Engine shutdown, PAN declared and the aircraft diverted to Manchester.	The nr3 thrust reverser light came ON in flight, and the aircraft diverted to Manchester. The reverser was locked out and the aircraft continued to destination iaw the MEL. Rectification of the defect and return to service was actioned by replacement of the inlet shut off valve and compliance with the requirements of AD 2002-08-17. See also 200206151.□ CAA Closure: The hazard is adequately controlled by existing requirements, procedures and documentation.
200304436	06/07/2003	En route	LAMSO	5 N	EGTT : London (FIR)	BOEING	Turbofan	2	Engine shutdown due to low oil pressure. PAN declared, fuel dumped and aircraft descended to FL170. Pilot then requested a further descent and diversion to Amsterdam.	
200304505	11/07/2003	Approach	Birmingham		EGTT : London (FIR)	BOEING	Turbofan	2	LH engine ran down and generator came off line with oil pressure in the red during the approach. No EICAS warnings.Emergency declared. Engine shutdown. Flap 25 landing carried out.	Whilst being vectored for an ILS to runway 33 at Birmingham, the LH engine ran down to 28% N3 and the left generator came off line with oil pressure in the red. Initial diagnosis was difficult as there were no EICAS warnings. Justprior to engine shutdown the engine valve light illuminated together with 'L ENG FUEL VAL' EICAS message. Further diagnosis was not possible due fuel state. Uneventful flap 20 landing carried out. HP fuel pump and Fuel Flow Governor (FFG) changed. Engine ground runs carried out satisfactory. See also 200305624.
200304525	11/07/2003	En route	Swansea		EGTT : London (FIR)	BOLKOW	Turboshaft	2	Nr2 engine mag chip caption illuminated in flight. Engineshutdown, aircraft diverted to Swansea and carried out a run on landing.	Mag plugs inspected and two small chips found on upper plug. Oil changed, 30 minute ground run carried out, no further chip indications reported.
200304744	18/07/2003	En route	Swansea		EGTT : London (FIR)	BOLKOW	Turboshaft	2	Nr1 engine mag chip caption illuminated in flight. Engineshutdown and run on landing carried out at destination.	Mag plugs inspected and two small particles found on gearbox plug. 30 minute ground run carried out, during which the chip caption again illuminated. Further particles foundon gearbox plug and engine rejected.
200304883	22/07/2003	En route	COWLY		EGTT : London (FIR)	BAE	Turbofan	4	PAN declared and aircraft returned due to possible shut down of one engine.	Uneventful landing carried out.
200304889	24/07/2003	Approach	Oil Rig		EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	2	Nr2 engine fire warning. Engine shut down. PAN declared. Aircraft returned.	On short finals to an offshore platform the nr2 engine fire warning caption illuminated and extinguished after approximately 2-3 seconds. This happened 3 times within 30 seconds with all other indications normal. Go around initiated, the aircraft climbed to 1000 feet and nr2 engine shutdown iaw checklist. PAN declared and aircraft returned to Blackpool.

200304954	26/07/2003	En route	Redhill (Surrey)		EGTT : London (FIR)	STAMPE	Reciprocating	1	Forward part of engine separated in flight. MAYDAY call. Forced landing in quarry. No injury to 1 POB. AAIB Field investigation.	AAIB Bulletin 10/2004, ref: EW/C2004/07/08 - Summary: The aircraft was cruising at 1,000 feet, with the engine at 1,900 RPM when the propeller, forward portion of crankshaft and forward upper portion of engine crankcase separated from the aircraft. The pilot closed the throttle, made a MAYDAY call and was able to make a forced landing without further damage. Examination showed that the crankshaft of the Gipsy 10 engine had fractured due to a fatigue crack, starting on the Nr1 crankpin aft radius, probably from a corrosion pit. The crack had spread to the crankpin bore and through the other side of the crankpin. At the time of the incident, the engine had accumulated 1,192 hours since its last full overhaul (estimated to have been around 1970) and had a 'top' overhaul, about 140 hours before the incident, in 1998. The engine was operating in an extension beyond the 1,000 recommended overhaul life, granted under CAA Airworthiness Notice 35. The AAIB made a Safety Recommendation (2004-75) to the UK CAA, recommending that the CAA specifies a calendar time limitation for the overhaul periods for Gipsy engines. See also 198402828, 199000836 and 199700233 - crankshaft failures for the same powerplant. CAA Closure: CAA FACTOR F46/2004, detailing the CAA's response to the one AAIB Safety Recommendation, was issued on 10 November 2004. Any further CAA action required will be progressed via the 'Annual Review of AAIB Recommendations' procedure.
200304979	21/07/2003	En route	Isle of Man (IOM)		EGTT : London (FIR)	PIPER	Reciprocating	2	RH engine shut down due to oil loss.	The pilot did not inform ATC that the RH engine had been shut down or the reason why. Full emergency declared by ATC and uneventful landing carried out. The Pilot has now submitted an MOR, and he has been de-briefed by the Chief Pilot as to the correct procedure to be followed in the event of an engine failure. CAA Closure: The hazard is adequately controlled by existing requirements, procedures and documentation.
200305045	25/07/2003	En route	Strumble (STU)	15 E	EGTT : London (FIR)	BOEING	Turbofan	2	PAN declared due to engine problem. Aircraft descended to FL270 and situation was reported to have stabilised. Aircraft returned.	
200305046	29/07/2003	En route			EGTT : London (FIR)	SIKORSKY	Turboshaft	2	Nr1 engine chip warning illuminated in flight - engine shutdown.	
200305051	21/07/2003	En route	Teesside (TD)		EGTT : London (FIR)	DASSAULT	Turbofan	2	Engine failure. Investigation revealed a birdstrike, resulting in engine flameout. No damage found.	Aircraft reported RH engine failure which had shut down. A second aircraft departed to complete a visual inspection, during which nothing unusual was observed, and a runway inspection reported no debris and a dry surface. Full aerodrome emergency declared. Aircraft landed safely. Investigation revealed a birdstrike, resulting in engine flameout. Engine borescope inspection carried out. No limiting damage found as a result of the inspections and the engine/aircraft returned to service. The aircraft has operated in excess of 34 hrs since the occurrence with no further incident. CAA Closure: The hazard is adequately controlled by existing requirements, procedures and documentation.
200305287	02/08/2003	Take-off	Redhill		EGTT : London (FIR)	OTHER	Reciprocating	1	Shadow Series CD: Engine failure after take off. Pilot carried out a 180deg left turn and landed in the Helicopter Training Area 1 (HTA 1). No damage or injuries reported.	
200305330	05/08/2003	En route	Manchester Barton A/F	3 W	EGTT : London (FIR)	OTHER	Reciprocating	1	Mainair Gemini Flash IIA Microlight carried out a forced landing due to engine failure. No damage or injuries reported.	
200305335	05/08/2003	Approach	Blackbushe		EGTT : London (FIR)	OTHER	Reciprocating	1	Engine stopped after landing.	Farnborough ATC advised Blackbushe ATC that they had lost R/T contact with a microlight which was inbound to Blackbushe. The aircraft appeared on finals for R/W08 Blackbushe, non-radio, and landed safely with AFS in attendance to escort it to parking. AFS then advised ATC that the engine of the aircraft had stopped. The R/W was temporarily blocked by the aircraft.
200305716	19/08/2003	Approach	Fenland		EGTT : London (FIR)	CESSNA	Reciprocating	1	Forced landing following engine failure.	Due to engine power loss during approach, fuel was selected to both tanks and carburettor heating applied, but power failed to recover. A safe landing was made in a field short of the runway. No injuries were incurred and no damage to the aircraft. The aircraft was recovered to the airfield where engineering inspection confirmed the aircraft was fit to fly. Following re-fuelling and power checks the flight recommenced.
200305731	03/08/2003	En route	Portishead (Somerset)		EGTT : London (FIR)	OTHER	Reciprocating	1	Engine failure. Aircraft landed on community playing fields.	Following an initial report to police of an aircraft crash on community playing fields, it was found MZPJ had landed safely after experiencing an engine failure, with a second aircraft landing behind to ensure the pilot was safe. Police attended the scene. After approximately 1½ hours, the engine fault was rectified and both aircraft proceeded on their flight. Microlight type: Team Minimax 91
200305731	03/08/2003	En route	Portishead (Somerset)		EGTT : London (FIR)	JABIRU	Reciprocating	1	Engine failure. Aircraft landed on community playing fields.	Following an initial report to police of an aircraft crash on community playing fields, it was found MZPJ had landed safely after experiencing an engine failure, with a second aircraft landing behind to ensure the pilot was safe. Police attended the scene. After approximately 1½ hours, the engine fault was rectified and both aircraft proceeded on their flight. Microlight type: Team Minimax 91
200305809	22/08/2003	En route			EGTT : London (FIR)	BAE	Turbofan	4	PAN declared due to engine problem. Precautionary descent carried out, engine shut down and flight continued on three engines.	
200306039	01/09/2003	En route	London-Gatwick - LGW	Nr	EGTT : London (FIR)	BOEING	Turbofan	2	Autothrust disconnected and LH engine EGT increased. Large throttle stagger required to match engines. Diverted to Gatwick. BVCU failure.	The aircraft had been grounded all day for the same technical fault, and rectification had been completed. At FL180 the autothrust disconnected and the LH engine EGT advanced into the yellow band. The LH engine was manually retarded to match the RH engine, resulting in a throttle stagger of 1-1.5 inches. The crew diverted to Gatwick following consultation with engineering. Extensive trouble shooting was carried out, and various components were changed. The fault was traced to a fault in the wiring to the Bleed Valve Control Unit (BVCU). The operator carried out a fleet check, but no other aircraft were found to be affected. It is considered that the correct engineering action was carried out. See also 200303919. CAA Closure: The hazard is acceptable provided the frequency remains low.
200306234	07/09/2003	En route	Bangor		EGTT : London (FIR)	EUROCOPTER	Turboshaft	2	Nr1 engine chip caution illuminated in flight. Engine shut down. Single engine approach/landing completed without further incident.	A small ferrous 'hair' was removed from the chip detector. Following a 15 minute ground run and satisfactory run down check, the detector was re-examined and found clean.
200306242	06/09/2003	En route	Teesside (TD)		EGTT : London (FIR)	BOLKOW	Turboshaft	2	Engine shutdown. Diverted to Teesside and landed safely with AFS in attendance.	Investigation established that the correct procedures had been followed. CAA Closure: The hazard is adequately controlled by existing requirements, procedures and documentation.
200306326	11/09/2003	En route	North Sea		EGTT : London (FIR)	SIKORSKY	Turboshaft	2	Main transmission chip warning on CWP. Checklist actioned, engine shutdown. PAN declared. Aircraft returned.	Procedure 7/1 carried out from EOP with no double indication. On return to base investigation found small amount of fuzz on both detectors. Detectors cleaned and refitted and oil drained/replenished. Leak checks and ground run carried out, chip warning recurred on/from the RH side. Wire to chip plug found to have approximately 1/8 inch length of insulation missing. Wire trimmed, recovered and inserted in plug. 30 minute heavy hover carried out, no further indications. Chip detectors re-examined and leak checks carried out, satisfactory.
200306379	12/09/2003	En route	Brize Norton		EGTT : London (FIR)	BEECH	Turboprop	2	RH engine shut down due to high torque indication. Aircraft returned. FCU and HP Fuel Pump replaced.	Following a normal take-off and just prior to level off at 3000ft, the RH engine torque was noted to be steady at just below the red line. When this was pointed out to the handling pilot he attempted to reduce the power to a normal setting without success. The throttle was then exercised through a reasonable range without any change to the engine condition. The checklist was consulted and the RH engine was shut down in accordance with the checklist and Standard Operating Procedures (SOPs) and the aircraft returned. An uneventful landing was carried out and the aircraft was then inspected by the fire services. Total aircraft hours 3945, total aircraft landings 3002. A thorough visual inspection of engine controls carried out - found serviceable. Engine ground runs carried out - unable to reproduce fault, trouble shooting carried out in accordance with MM. FCU and HP fuel pump replaced in accordance with MM 73-10 & 20 as these items were considered the most likely cause. Full engine ground runs carried out - found serviceable; aircraft returned to service with no further recurrence. See also 200803941. CAA Closure: The hazard is adequately controlled by existing requirements, procedures and documentation.

200306628	21/09/2003	En route			EGTT : London (FIR)	FOKKER	Turboprop	2	Gearbox 'Low Oil' warning. PAN declared and aircraft returned. Maintenance error.	Passing FL45 in the climb, the gearbox 'Low Level' warning flickered twice, then remained illuminated. The aircraftlevelled, the engine was shut down, a PAN declared and the aircraft returned to the departure airport. Subsequent inspection revealed the oil cap was not fitted. The gearboxwas refilled with fresh oil, the cap replaced but during a ground run the warning illuminated again after 30 seconds, with further investigation finding a large oil leak. Engineering investigation revealed an oil leak from the engine compressor attached to the gearbox. The end cap was found to be loose and leaking oil due to the threads for the attaching bolts being found stripped. The compressor was changed and the aircraft returned to service. The defectiveunit was sent to the OEM for workshop strip examination. Evidence was found that incorrect sealant had been used and the bolt threads stripped, possibly due to over tightening. A review of the aircraft records did not identify any previous work on the compressor to establish when this action took place or by whom. The organisation published a Quality Notice to bring this incident to the attention of the production staff. □ CAA Closure: The hazard is controlled by the actions stated above.
200306684	18/09/2003	En route	Shawbury (SWB)	20 N E	EGTT : London (FIR)	AGUSTA	Turboshaft	2	Nr1 engine chip warning. Nr1 throttle retarded. PAN declared. Engine shutdown and aircraft diverted to Shawbury.	Magnetic plugs and filter removed, small amount of debris/particles found on the upper and lower plugs, the upper plug causing the caution to illuminate. Magnetic plugs cleaned/refitted and 30 minute ground run carried out. Aircraft flown for 1 hour and 5 minutes with no recurrence.
200306690	23/09/2003	En route	Reigate		EGTT : London (FIR)	AVID	Reciprocating	1	Fuel feed fault and engine stopped. MAYDAY declared. Landed safely. 10 minutes later, engine started. Suspected carburettor icing.	
200306805	29/09/2003	En route	Lydd (LYD)	5nm SW	EGTT : London (FIR)	BOEING	Turbofan	2	Nr2 engine shut down. PAN declared.	
200307074	21/09/2003	En route	Dunsfold	15nm S	EGTT : London (FIR)	DE HAVILLAND	Reciprocating	2	RH engine oil pressure dropped below minimum required pressure. Engine shut down. Aircraft diverted to Farnborough and landed safely.	Investigation being progressed under 200306872.
200307605	04/08/2003	En route	Boscombe Down	18nm SW	EGTT : London (FIR)	PIPER	Reciprocating	2	RH engine throttle malfunction, fuel contents gauge inaccuracies and fuel loss. MAYDAY declared. Throttle linkage disconnection/incorrect installation. Fuel tank check valves unserviceable.	During flight test of the RH engine, retarding the throttle did not result in a power reduction although RPM and mixture control appeared to function correctly. The LH engine was maintained at a low power setting. During fuel transfer both RH and LH fuel gauge readings became erratic. Approx 30 minutes later the left low fuel pressure and left low pressure boost captions illuminated indicating fuel starvation of the LH engine. A MAYDAY was declared and the RHengine was shut down. A safe landing was carried out withthe LH engine at idle - the LH engine was then shut down.On vacating the aircraft, traces of fuel were evident on the LH wing behind the LH inner fuel tank filler cap. Subsequent inspection of the RH engine revealed that the cableball joint (p/n 31747-0) to the fuel injector throttle lever was disconnected and that the ball joint screw thread had been incorrectly installed with no sign of the stiff nut (p/n MS20364-1032C). Additional procedures have been put in place to reinforce the requirement for the locking nut to be renewed at each throttle cable disconnection. and a local amendment has been raised. No fault was found withthe fuel gauging system although the fuel contents senders (p/n 550-695 and 550-696) were replaced as a precaution.The aircraft was refuelled the outer fuel tanks were selected and when fuel booster pumps were started to transfer fuel it was noted that the associated fuel contents gauge started to rise gradually to the full indication. When theLH outboard fuel tank filler cap (p/n 531-001) was openedit was noted that air rushed into the tank. The check valves (p/n 492108) located on each fuel tank were removed for inspection and 3 out of the 4 valves were found to be stuck in the closed position with the pressure relief drillings completely blocked. This would cause the bag tanks to distort during fuel transfer causing either the fuel levelto rise or force bag tank distortion giving incorrect indication of fuel content. In addition the fuel cap on the LH inner fuel tank was found to be slightly loose in its receptacle which, allowed a considerable amount of fuel to be siphoned overboard from the LH inner tank. The reporter comments that there is no adequate servicing description for the check valves in the maintenance manual. All four fuel tank filler caps were replaced in addition to all four check valves.
200307691	23/10/2003	En route	Stansted		EGTT : London (FIR)	BAE	Turbofan	4	Nr3 engine ran down. Engine shut down. Aircraft returned.	During a C of A test flight an uncommanded run down of the nr3 engine occurred, with N2 dropping to 40% and an associated rise in TGT. The nr3 engine thrust lever was modulated and N2 increased but then ran down again to 40%. The engine was then shut down and the aircraft returned to Stansted without further incident. The fault was traced to thefuel control unit p/n 2-163-810-21, which was replaced.
200307952	13/11/2003	En route	East Midlands	5nm N	EGTT : London (FIR)	BAE	Turboprop	2	Nr2 engine shut down due to EGT/torque reduction. MAYDAY declared. Diversion to East Midlands. EGT wiring failed.	During cruise at FL160 in light to moderate icing conditions, ice collected on the propellers and the usual noise of shedding ice was heard but with associated abnormal vibration. Descent initiated and passing FL145 nr2 engine ran down. Anti-ice was on and appeared to be functioning normally. On levelling at FL120, 0% torque was noted with low EGT and no response to Power Lever movement. Nr2 engine wasshut down iaw checklist, MAYDAY declared and the aircraftdiverted to East Midlands. No fault was found during extensive troubleshooting and subsequent ground runs. Further engineering investigation established that torque and EGT problems were present on the Nr2 engine, and an engine change was carried out. The EGT indication problem was however still apparent but subsequent trouble shooting found wire KR40AL-A broken just behind connection plug 1KR31 in theEGT wiring harness. This defect was rectified and the aircraft has operated without further incident. See also 200308759.□ CAA Closure: The hazard is adequately controlled by the action stated above.
200308021	18/11/2003	En route	Barkway (BKY)		EGTT : London (FIR)	BOEING	Turbofan	2	AAIB Initial Notification : Loss of oil quantity and pressure. Engine shutdown. PAN declared. Aircraft landed safely.	
200308061	13/11/2003	Take-off	Bristol International		EGTT : London (FIR)	HAWKER SIDDELEY	Turboprop	2	Nr2 engine fire warning on climb out. No evidence of fire. Engine shutdown. Aircraft returned and landed safely with AFS in attendance.	Fault traced to the broken inner core of the fire detection wire element, wire replaced. Fire detection system tests carried out - satisfactory. See also 200306378.□ CAA Closure: The hazard is adequately controlled by the actions stated above.
200308282	29/11/2003	En route	Birmingham (West Midlands)		EGTT : London (FIR)	AIRBUS	Turbofan	2	Repeated surging of nr2 engine. Return to LHR initiated. Nr1 engine surge then suspected. MAYDAY declared and aircraft diverted to Birmingham. AAIB Field investigation.	AAIB Bulletin 11/2004, ref: EW/C2003/11/04 - Summary: On a relatively clear evening, upon reaching the cruise levelof FL280, the crew and passengers on a scheduled flight from London Heathrow to Edinburgh experienced momentary noise and vibration throughout the aircraft. This was repeated approximately one minute later; an orange flash associated with the right engine had also been seen. The flight crew identified that the nr2 engine had surged and recovered, with the engine indications returning to normal. The aircraft's Quick Reference Handbook, coupled with the training that the flight crew had received, provided them with inadequate guidance with which to fully assess the situation. Their initial intention to continue to Edinburgh was changed upon advice from the operator and the crew initiated a return to Heathrow. The engine then began to surge againand, once more, recovered, but this was followed by another series of surges. At this point the crew believed that the nr1 engine had also surged so they declared a MAYDAY and diverted, uneventfully, to Birmingham Airport. Subsequently, it was determined that a progressive fault in the nr2 engine P2T2 probe had signalled inaccurate values to theirn2 engine computer, resulting in incorrect scheduling ofthe compressor inlet guide vanes, and this was a direct cause of the engine surges. Four Safety Recommendations (2004-59 to -60) are made to the aircraft manufacturer as a result of this investigation.□ CAA Closure: CAA FACTOR F52/2004 was issued on 14 December 2004.
200308315	01/12/2003	En route	Spurn Point (North Sea)	10nm E	EGTT : London (FIR)	SIKORSKY	Turboshaft	2	Nr1 engine chip llight illuminated during descent. Engine shut down. PAN declared. Aircraft returned. Engine damage found.	At approx 1500ft during descent/approach to the GSE Labrador vessel, the nr1 engine chip light illuminated and would not clear after the circuit breaker was reset. The engine was shutdown iaw the aircraft checklist, a PAN was declared and a return initiated to Humberside. During the return flight the chip light remained illuminated at all times.Uneventful landing carried out with emergency services onstandby. Type 2 and 3 debris found on MP11, BMP and RMP. Modules 4 and 5 replaced. Module 5 Strip Report from repair shop confirms contamination as drive pinion teeth displayed pitting and impact marks. Total aircraft hours 7859.□ CAA Closure: The hazard is adequately controlled by existing requirements, procedures and documentation.
200308622	11/12/2003	En route	Frimley		EGTT : London (FIR)	BOLKOW	Turboshaft	2	Nr2 engine chip warning. Engine shutdown and flight continued to base for uneventful single engine landing.	Whilst climbing to cruise during the return flight to base, the nr2 engine chip detector caption illuminated. Fuzz burner cycled twice iaw FRCs - warning persisted. Engine shutdown and flight continued to base for uneventful singleengine landing. Upper magnetic chip detector found contaminated with one small flake. Detectors cleaned/re-installed and ground runs/leak checks carried out satisfactory.
200308665	15/12/2003	En route	Cambridge		EGTT : London (FIR)	DORNIER	Turboprop	2	LH engine in-flight shut down due to LH propeller oil pressure caption. Diversion to Cambridge. Low Oil Pressure (LOP) failed.	The aircraft landed safely with the LH engine shut down and with full emergency actions applied. Due to heavy braking, smoke was observed from the LH MLG which then dissipated after approx 10 minutes. Passenger disembarkation was carried out on the runway prior to the aircraft being taxied clear. The operator reports that the fault was traced toa defective LOP switch. This was replaced iaw the AMM andthe fault corrected. The LOP switch had achieved 9581 hrsand 10291 cycles. There was oil pressure available to thepropeller at all times, and the Engine was shut down as aprecaution. □ CAA Closure: The hazard has been adequatelycontrolled by existing requirements, procedures and documentation.

200308711	11/12/2003	Approach			EGTT : London (FIR)	PIPER	Reciprocating	2	Aircraft returned due to RH MLG unsafe indication. Visual circuits carried out - landing gear appeared down/locked, followed by a touch and go. Single engine landing carried out. MLG contaminated.	A full emergency was declared by ATC and the aircraft was vectored for an ILS to R/W26. Aircraft jacked, undercarriage inspected. Aircraft RH down lock hook rod found contaminated with engine exhaust products (carbon). Undercarriage cleaned and lubricated, functional serviceable. Review of past MORs reveals numerous incidents involving contamination of the aircraft down lock mechanism by carbon deposits. Aircraft operational procedures for the selection of MLG on approach are standard. Gear not to be extended early which would expose it to prolonged contamination. PperSL 755c issued in November 1985 increases the clean and lubrication periodicity to 50hrs. This has already been established in the operator's maintenance plan (MP). The operator has agreed to increase the clean and lubricate frequency to 25hrs.☐ CAA Closure: The hazard is adequately controlled by existing requirements, procedures and documentation.
200308721	13/12/2003	En route	Shoreham		EGTT : London (FIR)	PIPER	Reciprocating	2	MAYDAY declared due to LH engine failure. Following intention to divert to Southampton, aircraft reported engine running again. MAYDAY cancelled and flight continued.	
200308990	27/12/2003	En route			EGTT : London (FIR)	CESSNA	Reciprocating	2	PAN declared and aircraft returned to departure airfield due to fuel flow problems. RH engine shutdown.	Approximately 10 minutes after transiting through some towering cumulus cloud at FL100 where visible snow was present, the RH engine fuel flow was seen to increase and then fluctuate. After initiating a diversion to Leeds it was noted the engine was producing no power. Operation of the fuel booster pump, fuel selector and mixture failed to produce results and as the aircraft was unable to maintain height on one engine, a gradual descent was initiated. The engine was shut down, propeller feathered and a PAN declared prior to a straight in approach. It had been noted that prior to departure a fuel drain sampling check had produced a larger than normal water content, while subsequent investigation also collected significant quantities of water, predominantly from the RH tip tank and RH main fuel line. The fuel bowser was checked with no water present. The engine was started and ground run satisfactorily although further checks produced yet more water. Investigation noted the aircraft had been flown infrequently during the preceding 6 months and had been parked outside invariably with a partial fuel load. An overextended oleo had resulted in the aircraft adopting a slightly tail down attitude whilst parked, allowing water to pool around the fuel filler caps. Investigation by Maintenance Organisation confirmed that water contamination in the fuel system was the cause of the problems. The root cause, however, was found to be loosely fitting fuel filler caps. The caps had the seals replaced, were tightened and final water drain checks carried out before the aircraft was released back to service. Whilst no further faults reported since, the Maintenance Organisation has amended the Maintenance Schedule for the aircraft to include inspection of the overwing fuel filler caps for sealing and security.☐ CAA Closure: The hazard is controlled by the actions stated above.
200309046	30/12/2003	En route	Lands End (LND)	15nm W	EGTT : London (FIR)	SIKORSKY	Turboshaft	2	Nr1 engine fire warning in flight.	In the cruise at 1500ft, the nr1 engine fire warning illuminated and the associated audible warning sounded. Emergency checklist actioned and warning cleared as soon as the reserve extinguisher was fired. There were no obvious signs of fire but the nr1 engine was shut down and the aircraft continued to the destination airfield without further incident. Investigation found areas of low insulation resistance on flexible fire wires in both fore and aft locations. It is thought that a false warning was triggered by heavy rain affecting these areas of low resistance.
200309103	17/12/2003	Approach	Cranfield (CIT)		EGTT : London (FIR)	PIPER	Reciprocating	2	Loss of oil from LH engine due to loose oil filler cap.	During the pre-flight inspection it was noticed that the LH engine oil dipstick/filler appeared to 'click' on being tightened, suggesting the possibility of cross-threading. The cap was backed off then refitted, ensuring that it was not cross-threaded and therefore using minimum tightening. In flight it was observed that there was a large quantity of oil over the LH engine cowling. The engine was shut down and the aircraft returned and landed safely. The oil filler cap was found to have worked loose, to the extent that it was just sitting on the threads. The engine and nacelle were thoroughly cleaned and the engine was topped up with oil and run. All temperatures and pressures were normal, no problem was found with the dipstick cap and no leaks were evident. The oil filter was removed and cut open to check for contamination and was found clean. A new oil filter was fitted and the aircraft released to service. No further loosening of the cap has been noted.
200400054	07/01/2004	En route	North Sea		EGTT : London (FIR)	SIKORSKY	Turboshaft	2	Nr1 engine chip light illuminated. Checklist actioned but indication persisted. Engine shut down, PAN declared and aircraft continued to destination without further incident.	
200400121	11/01/2004	En route	RINGA		EGTT : London (FIR)	BOEING	Turbofan	2	PAN declared due to LH engine failure. Aircraft diverted to Manchester.	
200400271	15/01/2004	En route	North Sea		EGTT : London (FIR)	SIKORSKY	Turboshaft	2	Nr2 engine chip warning. Checklist actioned, engine shutdown. PAN declared. Flight continued without further incident.	See also 200304110 and 200304111.
200400348	20/01/2004	En route	London-Gatwick - LGW		EGTT : London (FIR)	BOEING	Turbofan	2	LH engine shut down due to loss of oil pressure and contents. Fuel dumped and aircraft returned. 'O' ring missing from pressure filter drain plug.	LH engine oil quantity message received then pressure reduced to zero. Engine shut down as per flight crew drills. Engine run for approx 90 seconds with zero oil quantity whilst checklist completed. When checked on ground, no oil was found in tank and there was evidence of a large oil leak from oil filter bowl drain plug area. Oil filter (pressure) drain plug loose - on removal 'O' ring was found missing. 'O' ring fitted, plug re-installed and high power engine run actioned. On completion of engine run, there was still evidence of oil seepage from the oil filter bowl drain plug. ADD raised for replacement of the filter bowl and drain plug. During the return an EICAS 'GND PROX SYS' warning occurred - the reporter believes this is associated with single engine operation.
200400516	27/01/2004	En route	Dorchester		EGTT : London (FIR)	DORNIER	Turboprop	2	During an air test, following a single engine climb, when the RH engine was restarted, ITT rose rapidly above the start limit towards the gauge limit of 1200deg C. Engine shutdown, aircraft returned.	Engine TPE331-5B-252D (Serial P-39234C) no fault was identified during engine investigation by manufacturer which could identify a reason for the overtemp during relight. The most likely cause of the overtemp on relight was over fuelling using manual enrichment. The Operator has revised the 'Standard Operating Procedure' for relight on this aircraft to mitigate the risk of recurrence.☐ CAA Closure: The hazard is adequately controlled by the action stated above.
200400549	22/01/2004	En route			EGTT : London (FIR)	SIKORSKY	Turboshaft	2	Nr2 engine chip warning illuminated. Engine shutdown and flight continued to base.	During power assurance check the nr2 engine chip warning illuminated. EOP carried out and flight continued to base for an uneventful single engine landing. Chip detectors, mag plugs, and oil filter inspected and chip detector MPI 1 found contaminated with a small sliver of metal. System drained and replenished and light on wheels ground run carried out with no further indications.
200400634	01/02/2004	En route	ORTAC	20nm N	EGTT : London (FIR)	SHORT	Turboprop	2	Oil loss from RH engine due to a leak from a pipe with a loose union nut.	An oily mist was noticed on the flight deck and in the cabin. The air conditioning was switched off and the mist began to dissipate. Less than 2 minutes later the RH engine oil pressure light flickered and the associated gauge showed reducing pressure. The checklist was consulted and, as the oil pressure reduced through 60psi, the engine was shut down. The flight continued to destination and the aircraft landed safely. The loss of oil pressure was caused by a leakage of oil from pipe p/n SD3-59-6002XB, which had a loose union nut. Oil filter and chip detector checked, oil system replenished and ground runs carried out with satisfactory results.
200400696	03/02/2004	En route	Cardiff (CDF)		EGTT : London (FIR)	ATR	Turboprop	2	Nr1 engine fire warning during climb out. MAYDAY declared. Aircraft returned. Fire detector elements damaged/low insulation resistance and connectors incorrectly installed.	During climb through 3500ft, nr1 engine fire indication annunciated. A MAYDAY was declared and "memory items" were actioned from the checklist, which resulted in an engine shut down, although there was no visible sign of fire. The aircraft then returned to departure airport and an uneventful landing was carried out with the fire services in attendance. After the aircraft had come to a complete stop the remaining engine was shut down and rapid passenger disembarkation was carried out using the normal exit. During subsequent inspection there was no evidence of any fire and no fault was found during initial BITE check. Continuity checks on the fire detector elements were satisfactory. Insulation resistance checks revealed that loops "A" and "B" on the intake loom had low resistance. Additionally the loop "A" inboard connector shorted to earth when moved and the centre electrode pin was found to be broken on the inboard connector. The upper element in loop "B" was also found to have low resistance. It was also noted that, although the connectors were wire-locked, they were all only finger-tight. The reporter confirms that this installation has not been disturbed since the aircraft was imported from Brazil in Aug 2003. The three suspect looms will be replaced. Total aircraft hours/landings 17896.30/18242, total aircraft hours since inspection 335.
200400704	02/02/2004	En route	East Midlands	21nm E	EGTT : London (FIR)	BRITTEN NORMAN	Turboprop	2	Nr1 engine chip warning illuminated. Engine shutdown, emergency procedures initiated by ATC and the aircraft landed safely.	Chip detector cleaned, ground runs completed and aircraft returned to service. The RR 250 engine is prone to this type of indication in the period of 'infancy' from overhaul, and although the flight manual recommends shutting the engine down, operating crews rarely opt to do this. This engine had completed only 55 hrs from turbine module overhaul when the indication occurred. The appropriate maintenance action was taken in accordance with RR AMM 72-00-00 page 331/332 and the engine returned to service. This engine has now operated a further 117 hrs without recurrence of the indication. Management of repeat indications is well understood by the maintenance organisation. See also 200404488.☐ CAA Closure: The hazard is adequately controlled by existing requirements, procedures and documentation.

200401238	28/02/2004	En route	Doncaster		EGTT : London (FIR)	DE HAVILLAND	Turboprop	2	Engine shutdown due to loss of nr2 engine oil pressure. Propeller Pitch Change Actuator Seal was found to be leaking.	During the cruise, MWP 'Nr2 Eng Oil Press' warning activated, with the oil pressure gauge noted to be falling slowly. Nr2 engine was reduced to Flight Idle and the propellerfeathered in accordance with the QRH. PAN declared. Following an initial period of recovery, oil pressure was seento reduce to 40psi, consequently the engine was shut down. The flight continued to its destination where an uneventful single engine landing followed. During engineering investigation, nr2 engine Propeller Pitch Change Actuator Seal was found to be leaking. Actuator (p/n: 790180-3) replaced due to leaks subsequently found in two locations. It isnoted the actuator, which has a MTBUR of 26512 hours, hadonly run 730 hours. A preliminary inspection prior to full strip did not reveal any defects with the actuator to explain the seal leakage. □ CAA Closure: The hazard is acceptable provided the frequency remains low.
200401297	29/02/2004	En route	Raglan		EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	2	Nr2 engine fuel filter warning illuminated in cruise. Checklist actioned, engine shutdown. Aircraft returned and a single engine run on landing carried out. Switch failed.	Fault traced to differential pressure switch on nr2 engine - switch, p/n 64301-030-1, changed and fault cleared. See also 200204616.
200401472	06/03/2004	En route	Lyneham	8nm NE	EGTT : London (FIR)	BEECH	Reciprocating	2	Uncontained LH engine failure less than 4 hours after cylinder repair.	During cruise there was slight engine vibration, which became more pronounced when power was reduced to commence the descent. All engine indications were normal, but when LHmanifold pressure was reduced the vibration became severeand an explosion was heard from the LH side of the aircraft. The outer cowlng door also separated and the rear passenger emergency exit window opened. The LH engine was then shut down and the aircraft returned and landed safely. The nr2 cylinder barrel had recently been repaired and the aircraft had flown no more than 3 hours 40 minutes since its re-installation. The engine had flown a total of 666 hours since factory overhaul and was not due a further overhaul until 1,500 hours. The engine was viewed just after removal from the airframe and again at the engine overhaul facility after it was stripped down, the airframe was also examined. On stripdwn fragments of the missing piston were discovered in the sump (weight 288 grms). Due to the lack of carbon deposits on these fragments it was presumed that these were part of the piston skirt. Parts of the oil control ring were also found in the oil system. The con rodfor the missing cylinder was also bent. The maintenance facility where the work had been carried out on the engine had the correct tooling (in calibration) and airworthinessdata (at the correct revision status) to carry out the task. Engineering staff were questioned and neither of the personnel involved with the work could recall any problems encountered during the work performed on the subject aircraft. During the previous day the idle speed of the subjectengine had been adjusted and the LH engine cowlng had been partially removed to carry out the work; during this work the engineer did not notice any sign of oil leaks or problems relating to the engine. After the work had been carried out the owner started the engine and a loud metallic "clang" was heard by the engineering personnel. The owner does not remember anything significant about the subsequent engine start. It is impossible to speculate weather the engine had been subject to a hydraulic lock during this start up. The engine manufacturer representative was contacted and he performed an inspection of the engine at the overhaul facility to find the possible cause of failure of the engine. There were five possible causes of the failure that are listed below; 1) A hydraulic lock of the nr2 piston/cylinder assembly, previous to this flight. 2) Failure of the nr2 piston assembly. 3) Failure of the piston rings fitted to the nr2 piston assembly. 4) Failure of the no2 cylinder assembly inlet/exhaust valves. 5) Over torqueing of the attachment studs and through bolts of the nr2 cylinder assembly. As the nr2 cylinder has never been recovered it is impossible to accurately determine the cause of the engine failure. □ CAA Closure: The hazard is acceptable provided the frequency remains low.
200401820	24/03/2004	En route	Daventry (DTY)		EGTT : London (FIR)	SHORT	Turboprop	2	PAN declared due to RH engine failure. Engine shut down and priority approach given.	Inquiries revealed that no evidence of a defect had been found on arrival at destination by inspection and full function checks. It is suspected that the power lever froze due to water ingress. The airframe OEM has subsequently revised the relevant Maintenance Programme (rev 22) to include routine lubrication of the engine controls and the AMM has also been amended to include maintenance practices forthe cables. □ CAA Closure: The hazard is adequately controlled by the actions stated above.
200402103	24/03/2004	En route			EGTT : London (FIR)	SHORT	Turboprop	2	Loss of RH engine power (torque) control. Engine shut down.	When approaching initial descent, it was found the RH power lever had seized and would not retard to a 'descent power' setting. During descent and a brief cruise at FL80, partial control was restored, allowing power to be reduced from 3000 to 2600lbs torque before the lever seized again. An emergency was declared and the RH engine shut down prior to a single engine landing.
200402243	10/04/2004	En route	Isle Of Man (IOM)	20nm NW	EGTT : London (FIR)	MCDONNELL DOUGLAS	Turbofan	3	Emergency declared due to nr3 engine shutdown. 7700 squawk displayed.	
200402276	30/03/2004	En route			EGTT : London (FIR)	BOEING	Turbofan	4	PAN declared following precautionary nr2 engine shutdown.D & D alerted.	
200402370	15/04/2004	En route	Daventry (DTY)		EGTT : London (FIR)	BAE	Turbofan	4	PAN declared due to precautionary engine shutdown. Diverted to Stansted and landed safely.	See also 200400289.
200402501	24/04/2004	En route	Dover (DVR) (Kent)		EGTT : London (FIR)	BOEING	Turbofan	4	AAIB Serious Incident: MAYDAY declared due to failure of one engine and loss of thrust on the other three. Aircraftdiverted to Heathrow. AAIB Field investigation.	AAIB Bulletin 1/2006, ref: EW/C2004/04/04 - Summary: The aircraft was carrying out a cargo flight from Ramstein in Germany to Wright Field in New York State. Shortly after reaching a cruising level of FL360, the LH outboard engine ran down and could not be restarted. It was decided to return to Ramstein and the aircraft descended to FL210 and took up an easterly heading. The crew determined that the three remaining engines were not producing the selected thrust and declared an emergency, requesting a diversion to London Heathrow Airport. The aircraft was radar vectored onto the final approach track for Runway 27R and the commander completed a successful approach to a safe landing. Significant thrust was available and used during the final stages of the approach and the aircraft was taxied under its own power. No reasons were found which could account for either the apparent run-down of No 1 engine or the crew's subsequent perception that the remaining three engines were not delivering selected thrust. Whilst only the engine EPRwas recorded on the FDR, it was clear from the evidence given by the crew and the aircraft performance that following the run down of the left outboard engine, the three remaining engines were not producing the thrust expected. This situation appears to have arisen following the descent from FL310 to FL210 and was symptomatic of a problem commonto all three operative engines but this could not be proved. The aircraft diverted to the only airport that the flight crew considered suitable and in the process, flew oversome of the most congested parts of London in a gliding configuration from which a safe landing was not reasonably assured. Three Safety Recommendations (2005-069 to 2005-071) were made, of which one was addressed to the UK Civil Aviation Authority, and a previous recommendation (2003-66)was re-iterated... □ CAA Closure: CAA FACTOR F5/2006, detailing the CAA responses to the three AAIB Safety Recommendations, was issued on 10 February 2006. Any further CAA action required will be progressed via the 'Annual Review of AAIB Recommendations' procedure.
200402536	25/04/2004	En route	En Route		EGTT : London (FIR)	BOEING	Turbofan	4	Nr4 engine low oil pressure. Engine shut down. PAN declared.	On the preceding sector, nr4 engine oil filter warning annunciated. Although the aircraft received maintenance input on turn-around, the warning recurred on engine start. During the cruise, oil pressure reduced to 8psi with an associated EICAS 'Eng 4 Oil Pressure' warning. QRH actioned, engine shut down and PAN declared.
200402659	29/04/2004	En route	Brecon (BCN)	10nm S	EGTT : London (FIR)	SAAB	Turboprop	2	LH engine low oil pressure warning and propeller gearbox pressure fluctuation. Diversion. Oil pressure transmitter contaminated.	At FL140 during cruise, "L ENG OIL PRESS" warning illuminated on the Central Warning Panel (CWP) together with a master warning and LH propeller gearbox pressure fluctuated between 0 and 150psi. "PROP OIL PRESSURE LOW" checklist was consulted with no positive result. There were no other abnormal engine/propeller indications and none were evidentduring visual inspection of the LH engine. ATC were informed and a diversion to Bristol was carried out. LH engine was operated on minimum power for the remainder of the flight followed by an uneventful landing at destination. Aircraft taxied to stand and engines shut down. The problem recurred one month later when, after the aircraft had levelled at 15000ft, the LH propeller oil pressure began to fluctuate between zero and 50psi, triggering a master caution.Checklist actions required that the LH engine be shutdown. An emergency was then declared and the aircraft returnedand landed safely. Investigation revealed that the low oil pressure indication was a false indication caused by theoil pressure transmitter connector being contaminated by oil. The oil originated from a leaking propeller/gearbox seal which migrated into the oil pressure transmitter connector. Rectification action included replacement of the propeller oil seal and cleaning of the oil pressure transmitter connector. Aircraft was released to service with no further defects. Follow up action recommended to the operators maintenance organisation included amendment of the maintenance programme to specify an inspection of the oil pressure transmitter for oil contamination at 800 hour intervals and/or sealing of the transmitter connector. Recommendations notified to organisation under JAR 145 audit findingsetter following the August 2004 routine audit. See also200406700. □ CAA Closure: The hazard is adequately controlled by the action stated above.
200402917	04/05/2004	En route	Cranwell		EGTT : London (FIR)	SLINGSBY	Reciprocating	1	Engine stopped during descent.	Approximately 20 to 30 seconds after the aircraft was putinto a gentle sideslip to hasten the rate of descent, theengine rpm fluctuated and quickly fell to zero. MAYDAY declared while the wings were levelled and tanks changed, following which power immediately restored. The aircraft landed uneventfully. Subsequent engineering investigation failed to find any cause, with engineers being unable to reproduce the fault. It is presumed that the sideslip divertedfuel from the flop tube which resulted in engine fuel starvation.
200403090	17/05/2004	Take-off	Birmingham		EGTT : London (FIR)	AIRBUS	Turbofan	2	Engine failure on take-off. Stage 4 HPC blade failure.	During a normal take-off, power stabilised and the aircraft accelerated to approximately 20kts when two loud bangs were heard from the LH engine. The aircraft swung to the left and vibration was felt throughout the airframe. A controlled stop was made on the runway and the park brake set,following which ECAM 'Eng 1 Fail' warning activated. EGT was seen to be rising to +650deg prior to master shutdown and ATC reported a small quantity of white smoke from the rear of nr1 engine, although there were no fire indications and no apparent cause for the failure. The aircraft cleared the runway under its own power with no further problems encountered during taxi to a remote stand. This event was the result of engine stage 4 HPC blade failure. Extensive review, investigation and reports have been undertaken by the aircraft manufacturer, the engine manufacturer and the Operator into this and similar events. The cause of this failure arises from HPC4 blades which had been previously stressed in pre mod engines and used in post mod rebuilds. The blades are subsequently cracking which results in an IFSD. The Operator has initiated a "Surgical Strike" programme to introduce the final trenching mod with the installation of a new HPC4 blade set on high risk engines. Thisprogramme requires a shop visit and engine disassembly scheduled within the next six months. In the interim, the engine manufacturers have introduced an on-wing NDT technique to inspect the blades for evidence of cracks. This NDT is presently being accomplished and planned to be completedprior to the end of October 2004. □ CAA Closure: The hazard is adequately controlled by the actions stated above.
200403514	31/05/2004	Approach	Liverpool		EGTT : London (FIR)	PIPER	Reciprocating	1	Engine failed on short finals. MAYDAY declared.	During final approach, aircraft declared MAYDAY due to engine failure and reported landing on an adjacent disused airfield. Engine then restarted, approach completed and landed safely. Local standby initiated.
200403526	02/06/2004	Approach	North Sea		EGTT : London (FIR)	SIKORSKY	Turboshaft	2	PAN declared due to nr2 engine failure in flight. Aircraft returned and landed safely.	During the cruise the nr2 engine overspeed caption was seen to flicker several times but the flight continued as the light then remained off. However, the nr2 engine failed as the aircraft slowed for the final approach to an offshore platform. The engine was shut down, a PAN was declared and the aircraft returned to Norwich. A visual inspection of the engine was carried out, both internally and externally, but nothing abnormal was observed. The turbine and compressor were found to rotate normally and all other associated components were inspected with nothing significant seen. During ground runs the nr2 overspeed light came on. The overspeed boxes were swapped over and a further ground run carried out, during which the nr1 engine overspeed light flickered. A replacement overspeed box was fitted and both systems then operated normally during ground and air tests.

200403576	29/05/2004	Take-off	Southend (SND)		EGTT : London (FIR)	WESTLAND	Turboshaft	2	PAN declared with one engine shut down due to oil warning. Aircraft landed safely with AFS in attendance.	
200403754	08/06/2004	En route			EGTT : London (FIR)	OTHER	Unknown		Squawk 7700 declared due to engine shutdown.	Aircraft instructed to squawk 7700 due to engine shutdowncaused by an oil leak. ATC lost communication due to poorRT coverage, but another passing aircraft informed ATC that fuel was being dumped prior to a return to the departure airfield.
200404068	19/06/2004	Take-off	Birmingham		EGTT : London (FIR)	BOEING	Turbofan	2	Birdstrike on take-off. LH engine shut down and aircraft returned due to high vibration.	At approx 100kts during take-off a flock of pigeons was encountered which passed on both sides of the aircraft withaccompanying noise and vibration. Primary engine instruments remained normal although after the aircraft was airborne with gear up, the LH engine vibration indication showedmaximum 5. Thrust was reduced to idle and engine vibration returned to 0.3. QRH "Engine High Vibration Drill" was actioned and high vibration returned as soon as the thrust lever was advanced. It was then decided to leave the thrust lever at idle and start the APU. "Engine shut down drill" was actioned with the engine at idle and the aircraft then returned for an uneventful single engine flap20 landing. The fire services inspected the brakes and then followedthe aircraft to stand.
200404295	25/06/2004	En route	Oxford		EGTT : London (FIR)	PIPER	Reciprocating	2	RH EGT overtemp - engine shutdown. Cylinder Head Temperature (CHT) probe and gauge replaced.	Prior to flight it was noted that the aircraft was operating with an ADD for 'high EGT on RH engine'. Therefore, EGTs were monitored throughout the take off and climb with no abnormalities apparent. However, once established in thecruise, RH EGT continued to increase towards 1550deg C then suddenly rose to 1580deg C. The relevant drills were actioned, the RH engine was shutdown and the aircraft returned and landed safely. CHT probe and gauge replaced, fuel flows enriched at top end and ground run carried out with satisfactory results. High EGT attributed to lean mixture - EGT system check calibrated and minor adjustments made.
200404346	02/07/2004	En route	Maldon		EGTT : London (FIR)	EUROCOPTER	Turboshaft	2	Nr2 engine MCD caption illuminated in flight. Fuzz burneractivated but caption did not clear. Engine shutdown law emergency checklist and aircraft returned to base.	On inspecting the MCD, the forward plug was found to have retained a single fine sliver approx 2mm in length: the aft plug was clean. SOA sample taken, engine run down checkcarried out (42 seconds) and oil system drained and flushed. One-off checks of MCD and filter scheduled for 5 and 25 hours respectively. Ground run and leak check carried out with satisfactory results. A further similar event occurred three days later, after which the forward engine gearbox plug was found to be contaminated with several stainless steel particles of two origins. Advice from the engine manufacturer is that the subsequent particle analysis confirmed the 3x Starter Generator Magnetic Seal as potential source. The reporter intends to remove and examine each seal in turn and replace any distressed items. See also 200306886. □ CAA Closure: The hazard is adequately controlled by the actions stated above.
200404506	08/07/2004	En route	London-Gatwick - LGW		EGTT : London (FIR)	BOEING	Turbofan	2	Engine shut down due to high vibration warning. Investigation, including inspection by borescope confirmed significant damage to the HP compressor. Probably caused by loss of liner.	During descent, an EICAS warning activated indicating RH engine N3 vibration in the 'Amber' band and peaking at 3 units. ORH drills carried out but with the thrust levers atidle, vibration remained high. RH engine shut down in accordance with the ORH and a PAN declared prior to an uneventful single engine landing with emergency services in attendance. Investigation, including inspection by borescope confirmed significant damage to the HP compressor. The AP compressor had been exposed and blades sent to the OEM for laboratory investigation. Further investigation found damage to HPC stages 2, 3, 4, 5 and 6. One HPC stage 2 blade had 100% chord missing to a depth of approx 1/2" at the tip, a further two blades had 33% chord missing and 85 % of blades were damaged. The OEM was unable to confirm the cause of loss of leading edge tip, one possible cause could have been rubbing or loss of lining material.□ CAA Closure: No further CAA action required at this time.
200404852	16/07/2004	En route	Polehill (POL)		EGTT : London (FIR)	LOCKHEED	Turboprop	4	Emergency declared with one engine shutdown. Aircraft instructed to squawk 7700. Fuel dumped, aircraft returned andlanded safely.	
200404943	22/07/2004	En route	Frinted (Kent)	Nr Sittingbourne	EGTT : London (FIR)	PIPER	Reciprocating	2	Aircraft crash landed after engine failed to restart following practice shut down. Aircraft destroyed. Serious injuries to 2 POB. AAIB AARF investigation.	AAIB Bulletin 2/2005, ref: EW/G2004/07/19 - Summary: The aircraft was being flown on a Continued Airworthiness Flight Test as part of the Certificate of Airworthiness renewal process. A single engine climb was carried out with the left engine performing normally at maximum continuous power. Although not required by the flight test schedule, the pilot decided to repeat the exercise on the right engine, but during the second single engine climb the right enginefailed. Attempts to restart either engine were unsuccessful and the aircraft crash landed in a field of crops, causing injury to both occupants. The aircraft suffered extensive damage and was written off.□ CAA Closure: No CAA action appropriate.
200404977	22/07/2004	En route	Irish Sea		EGTT : London (FIR)	BOEING	Turbofan	4	Nr3 engine vibration warning. PAN declared. Drills completed and engine shutdown. Investigation identified the cause as poor application of lubricant on the fan blades during scheduled maintenance.	In cruise at FL370 nr3 engine vibration caption illuminated with 4 units indicated on both channels. Drills completed and the engine was shutdown. Nr3 engine fan blades removed, root inspected and cleaned. Blades replaced and bladegap checked satisfactorily. Duplicate inspection carried out on nr3 N1 fan and spinner. There has since been no recurrence of the event. Investigation identified the cause as poor application of lubricant on the fan blades, which is a scheduled maintenance task. Problem cleared by improved maintenance practice. The operator's maintenance supportorganisation have been made aware and taken appropriate action. See also 200404165.□ CAA Closure: The hazard is adequately controlled by existing requirements, procedures and documentation.
200405225	28/07/2004	En route	LAKEY	20nm S	EGTT : London (FIR)	BEECH	Turboprop	2	PAN declared with one engine shutdown. Aircraft diverted to Manchester and landed safely.	
200405270	01/08/2004	Take-off	Isle of Man (IOM)		EGTT : London (FIR)	DE HAVILLAND	Turboprop	2	Nr2 engine shut down due to low oil pressure. PAN declared. Aircraft returned. Fault found in oil transducer; replaced transducer.	During climb checks, nr2 engine oil pressure was noted at45/51. Appropriate ORH drill actioned and engine shut down. A PAN was declared and a single engine return carried out. Fault traced to Oil pressure transducer; transducer replaced aircraft returned to service. However strip report no defect found. Nil further defects reported, The aircraft manufacturer was unable to determine the fault based on the information provided. They have therefore raised an 'SER' for tracking purposes. Incident classes as one off spurious occurrence.□ CAA Closure: The hazard is acceptable provided the frequency remains low.
200405334	04/08/2004	Approach	Newquay - St Mawgan		EGTT : London (FIR)	DE HAVILLAND	Turboprop	2	Uncontrollable torque on RH engine during approach. Precautionary engine shutdown. Stepper motor found defective and replaced.	On short finals, with the power levers level and LH engine indicating 20%, the RH engine torque became uncontrollable, fluctuating between 15-60% and causing the aircraft tosing in flight. Precautionary engine shutdown carried out prior to a single engine landing. Subsequent troubleshooting identified MFCU (Stepper motor) fault p/n 3244853-18, Serial No B2726N. Part removed and sent for overhaul. Standard Aero strip report findings, Stepper motor found defective and replaced. Unit Test serviceable.□ CAA Closure: The hazard is adequately controlled by existing requirements, procedures and documentation.
200405384	04/08/2004	Approach	Cranfield (CIT)		EGTT : London (FIR)	AVIONS ROBIN	Reciprocating	1	Engine reported as rough running during approach. Engine then stopped. Aircraft glided to runway where it landed safely.	
200405463	09/08/2004	En route	Tatenhill	2 S W	EGTT : London (FIR)	AGUSTA	Turboshaft	2	PAN declared with nr2 engine shutdown. Aircraft diverted to Birmingham and landed safely.	
200405704	16/08/2004	En route	Ellesmere Port		EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	2	Acrid electrical burning smell in cockpit followed by nr1engine chip warning. Engine shutdown and aircraft diverted to Hawarden.	On investigation excessive debris was found on the rear magnetic chip detector and rotational noise was evident. Engine oil level was found to be low with no evidence of external loss. Engine removed and returned to manufacturer for further investigation.
200405708	16/08/2004	En route	Trent (TNT)		EGTT : London (FIR)	BOEING	Turbofan	2	PAN declared due to engine failure. Aircraft returned with one engine shutdown.	
200405737	17/08/2004	En route			EGTT : London (FIR)	LOCKHEED	Turboprop	4	PAN declared due to oil loss from nr3 engine. Engine shutdown.	
200405857	22/08/2004	En route	Sherburn in Elmet	1nm S	EGTT : London (FIR)	DE HAVILLAND	Reciprocating	2	PAN declared due to engine oil pressure problem. Engine subsequently shutdown and call upgraded to MAYDAY. Aircraftdiverted to Leeds/Bradford and landed safely.	

200405914	27/07/2004	En route	Exeter		EGTT : London (FIR)	CESSNA	Turbofan	2	RH engine shutdown due to loss of oil pressure.	Master warning accompanied by rapid decrease in RH engineoil pressure. Engine shutdown. After landing it was apparent that a significant amount of oil had been lost and thefiller cap/dipstick was found to be open. The oil levels had been checked prior to the flight and the student pilotwas sure the filler cap was secure. The operator has now introduced a duplicate check for oil filler cap security.
200406252	02/09/2004	Approach	Isle of Man (IOM)		EGTT : London (FIR)	BAE	Turboprop	2	Precautionary engine shutdown.	During approach, LH engine 'Low Oil Pressure' warning activated. Engine shut down. Full emergency declared at destination airport but aircraft landed without incident.
200406345	05/09/2004	En route	Manchester Barton A/F		EGTT : London (FIR)	OTHER	Reciprocating	1	PAN and MAYDAY declared on two consecutive flights due toengine failure.	PAN declared due to engine failure. Engine restarted and the aircraft landed safely with fire services in attendance. On the following flight, MAYDAY declared, also due to engine failure, 2 miles from airport. Fire services alertedand proceeded towards the scene but stood down when aircraft reported safe landing.
200406700	17/09/2004	En route	ORTAC		EGTT : London (FIR)	SAAB	Turboprop	2	LH propeller oil pressure fluctuated followed by Central Warning Panel (CWP) caption. Aircraft returned. Pressure fell to 0 psi and QRH actioned/engine shutdown. Uneventful landing carried out.	At the time of the first warning the aircraft was climbing in IMC in moderate rain. Investigation traced the cause to fluid contamination of the oil pressure transmitter connector. The connector was removed, cleaned and sealed. System operation was restored and the aircraft was returned to service. See also 200402659. □ CAA Closure: No further CAA action required at this time.
200406919	24/09/2004	En route	Oxford		EGTT : London (FIR)	FOKKER	Turboprop	2	Nr2 engine oil pressure fell to zero and associated warning illuminated. Engine shutdown, PAN declared and aircraftdiverted to Bournemouth. Gasket failed between cylinder and hub of nr2 engine prop.	Fault traced to gasket leak between cylinder and hub of nr2 propeller - propeller replaced. Investigation revealed a gasket leak between the cylinder and hub of the nr engine propeller. No.2 propeller assembly was changed. The unitis generally reliable, no further action proposed. See also MOR 200407212.□ CAA Closure: The hazard is acceptable provided the frequency remains low.
200407024	25/09/2004	En route	LMS T SECTOR		EGTT : London (FIR)	LOCKHEED	Turboprop	4	PAN declared due to engine shutdown. Descent given. Aircraft returned.	
200407160	03/10/2004	En route	Luton (LUT)		EGTT : London (FIR)	BOEING	Turbofan	2	Following departure, the aircraft reported imminent engine failure. PAN then declared confirming LH engine had failed. Aircraft returned to departure airport.	
200407172	24/09/2004	En route	Daventry (DTY)	10nm SW	EGTT : London (FIR)	FOKKER	Turboprop	2	PAN declared due to a rough running engine. RH engine shut down and aircraft diverted to Bournemouth. Gasket had failed between cylinder and hub of nr2 engine prop.	Subject aircraft was identified and the fault traced to agasket leak between the cylinder and hub of nr2 propeller- propeller replaced. Investigation revealed a gasket leak between the cylinder and hub of the nr engine propeller.nr2 propeller assembly was changed. The unit is generallyreliable, no further action proposed. See also MOR 200406919.□ CAA Closure: The hazard is acceptable provided the frequency remains low.
200407176	04/10/2004	En route	Plymouth		EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	2	Nr1 engine chip caption illuminated in climb. Checklist actioned/engine shutdown. PAN declared, aircraft returned and an uneventful single engine running landing carried out.	Ferrous metal contamination found on forward chip detector, oil filter and screen. Engine rejected law Maintenance Manual. The reporter states that there was no previous history of contamination of this engine and SOAP sample and HUMS results showed no indication of impending failure. Engine despatched to manufacturer for strip report.
200407245	07/10/2004	En route	North Sea (North Sea)		EGTT : London (FIR)	SIKORSKY	Turboshaft	2	Nr2 engine chip warning. Circuit breaker reset but warning persisted. Emergency checklist actioned.	Anglia Radar advised. See also 200403885.
200407454	17/10/2004	Manoeuvring	London - Area (Greater London)	Central London	EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	2	RH engine shut down due to decreasing oil pressure following a chip warning. PAN declared. Diversion. Single particle found contaminating the chip detector.	During the hover, the RH engine chip caption was displayed. The aircraft was transitioned into forward flight and arequest made to ATC for return to base. There were no other adverse engine indications and both engines were kept running as the aircraft was over a congested area. The Flight Reference Cards (FRCs) were referred to and after approx a minute the RH engine oil pressure decreased. The RH engine was then shut down, a PAN was declared and the aircraft diverted to Stapleford where an uneventful single engine landing was carried out. Single particle found contaminating the chip detector. Debris removed, sent for analysis,ground runs conducted, oil samples taken and found free of contaminant. Aircraft released to service.
200407530	18/10/2004	En route	Yeovil	7nm SW	EGTT : London (FIR)	WESTLAND	Turboshaft	2	PAN declared due to double engine malfunction indication.Aircraft returned and landed safely with AFS in attendance.	
200407532	17/10/2004	En route			EGTT : London (FIR)	DE HAVILLAND	Turboprop	2	Propeller overspeed after air start of nr2 engine. Crew error.	Having completed a V2 +20kt timed climb, with the nr2 engine shutdown, the nr2 engine restarted normally. However, on moving the nr2 condition lever angle (CLA) from start feather to min 850 rpm, the propeller went straight to overspeed condition (1060 rpm). The power lever was at flightidle so there was no control over propeller speed. The nr2 engine was shutdown, a PAN declared and a single engine approach to Exeter was completed normally, where a full emergency had been initiated. Engineering investigation failed to locate any faults. An FDR download, however, revealed nr2 engine restart was attempted with the power lever angle at a position out of flight idle. Fault isolation manual indicates probable cause when these two codes are triggered together 'Flight deck mishandling. FDR records nr2 engine attempted to start with power lever angle (PLA) in position out of FI detent. Subsequent engine runs and a testflight with nr2 engine shut down with successful relight completed. Occurrence considered to be crew error.□ CAA Closure: The hazard is adequately controlled by existing requirements, procedures and documentation.
200407569	18/10/2004	En route	Coventry		EGTT : London (FIR)	DE HAVILLAND	Reciprocating	2	PAN declared due to engine shutdown. Full emergency initiated by ATC. Aircraft landed safely. Investigation to the occurrence identified an incorrect oil filling procedure prior to departure.	Inquiries reveal this incident occurred during a trainingdetail, during which a slight and intermittent rough running was observed on one engine, for which the crew electedto divert to Coventry. En-route, the oil pressure began to drop although the oil temperature remained constant. As the aircraft was by now close to Coventry, the pilot elected to feather the engine and made an un-eventful, single engine landing. Investigation to the occurrence identified an incorrect oil filling procedure prior to departure. Seealso 200307074 and 200405857.□ CAA Closure: The hazard isadequately controlled by existing requirements, procedures and documentation. .
200407720	20/10/2004	Approach	Liverpool		EGTT : London (FIR)	PIPER	Reciprocating	2	Engine loss on approach. Single engine landing carried out.	One engine was shut down due to adverse indications at approx 50ft on short finals. Uneventful single engine landing carried out.
200407790	27/10/2004	En route	En Route (English Channel)		EGTT : London (FIR)	SIKORSKY	Turboshaft	2	Unidentified in-flight engine noise due to salt contamination of both engine compressors. PAN declared.	Whilst in the cruise at 1000ft during the second flight of the afternoon schedule, a loud rapid sound lasting approx 5 seconds was heard from overhead, although there were no unusual indications. A PAN was declared and approx 1 minute later the noise recurred, again with no unusual indications. Whilst in slow descent on approach using a torque of 50% on each engine, the same noise occurred again (lasting between 4 and 7 seconds) from overhead to the right of the pilot. This time nr1 engine indications showed Ng 80% and falling, T5 800deg and torque 0% and nr2 engine indications showed Ng unknown, T5 800deg and torque 100%. Both engines recovered to normal followed by normal approach andlanding. During subsequent investigation, both compressors were found with salt contamination, therefore a chemicalwash was carried out. The reporter comments that due to wind direction and speed during flight, the air would have been salt-laden. Nr1 engine power curve satisfactorily carried out, HUMS check revealed no exceedance - 841deg C formore than 2 seconds was not exceeded. The reporter confirms that the primary cause of the incident was salt contamination as a result of operation in extreme weather conditions with visible sea spray less than 500ft from the operating apron. The reporter comments that the engines had beenwashed prior to departure (under current company policy) and would have been washed after the third flight unless the crew had requested an earlier wash. A review of engine washing policy in strong winds will be carried out.
200408229	11/11/2004	En route	Isle Of Wight (Isle of Wight)	Overhead	EGTT : London (FIR)	ATR	Turboprop	2	Nr1 engine run down and associated yaw following oil low pressure warning. Engine shut down and MAYDAY declared. Diversion to Southampton. Faulty engine replaced and aircraft returned to service.	Faulty engine replaced and aircraft returned to service. Strip report for failed engine to be reviewed by operator.□ CAA Closure: The hazard is adequately controlled by the actions stated above.
200408378	16/11/2004	En route		19 N E	EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	2	Fuel filter electrical warning.	PAN declared due to fuel filter problem with aircraft running on one engine. Aircraft diverted to North Denes. Fullemergency initiated by ATC. Engine subsequently restartedand an uneventful landing carried out.

200408419	18/11/2004	En route			EGTT : London (FIR)	AIRBUS	Turbofan	2	Nr1 engine FADEC failure caused by a loss of parameters (LOP) event. Engine shutdown, fuel dumped and the aircraft returned. SB issued.	Climbing through FL240 an ECAM caution "ENG 1 FADEC FAULT" appeared. The nr1 engine parameters showed amber XXs on the engine warning and system displays. Further checks established that the nr1 engine was running but the power waslocked at climb setting. Prior to engine shutdown and subsequent return to Gatwick, OEB 44/1 was consulted and it was confirmed that an engine relight could be carried out if, after shutdown, the engine parameters were normal. The shutdown and relight procedures were actioned and, after 30 minutes delay jettisoning fuel, a normal landing was conducted without further incident. The incident was thought to have the symptoms of a loss of parameters (LOP) event. The EEC was sent to the OEM for test and categorised Faultnot Found. The aircraft DFDR confirmed fuel blip to zero with a loss of parameters. Parameters returned when the engine was shut down and restarted. The OEM have issued SB RB.211-73-AE324 for LOP occurrences of this nature, and the EEC concerned has now been modified to this SB software at issue 12.4 and released back in to service. See also 200301478 and 200501479.□ CAA Closure: The hazard is adequately controlled by the actions stated above.
200408465	19/11/2004	En route	Parham		EGTT : London (FIR)	EUROCOPTER	Turboshaft	2	Nr1 engine chip light illuminated in cruise. Engine shutdown and precautionary landing carried out.	Chip plug and filters inspected - light fuzz present. Oilchange carried out followed by ground run with no further warnings. On the following day, during check 'A' inspection, further debris was found and the engine rejected iaw MM.
200408553	19/11/2004	En route	North Sea		EGTT : London (FIR)	SIKORSKY	Turboshaft	2	PAN declared due to nr1 engine oil pressure fluctuation. Engine shutdown. Diverted to Norwich and landed safely.	At 1252hrs the pilot reported a minor technical problem and diverting to base (North Denes). When questioned as to the nature of the problem the pilot advised 'oil pressure fluctuation warning on the nr1 engine'. Several minutes later the pilot declared a PAN with nr1 engine shutdown and unable to maintain altitude. Pilot was instructed to squawk 7700 and then elected to divert to Norwich. The engine was replaced after appropriate fault diagnosis.□ CAA Closure: The hazard is adequately controlled by existing requirements, procedures and documentation.
200408771	29/11/2004	En route	Liverpool		EGTT : London (FIR)	AGUSTA	Turboshaft	2	Engine shutdown. Diverted to Liverpool were full emergency declared. Aircraft landed safely.	
200408817	30/11/2004	En route	Colchester		EGTT : London (FIR)	PIPER	Reciprocating	2	Engine failure following airborne re-start.	The aircraft was being flown on an airworthiness flight test with the LH engine having been shut down for just over five minutes (to complete a One Engine Inoperative - OEI climb on the right) before being successfully restarted using the aircraft flight manual procedure. After approximately two minutes, with 2500rpm set, a sudden change in engine noise and vibration alerted the crew to an engine malfunction. Approximately 1800rpm was achieved initially but further in-flight fault diagnosis failed to achieve any power improvement. Power and rpm gradually reduced during the following 8 minutes until 1000rpm was reached, at which point the engine (IO-360-C1E6) was feathered and a successful landing achieved on the RH engine. Detailed examination by the manufacturer has identified that the failure occurred due to ductile cracking of the propeller governor idler gear in overload. The investigation was not able to identify the exact cause of this overload.□ CAA Closure: The hazard is acceptable provided the frequency remains low.
200408947	04/12/2004	En route	Southampton (SAM)	5nm E	EGTT : London (FIR)	DE HAVILLAND	Turboprop	2	Nr2 engine shut down due to fire warning during descent. MAYDAY declared. Fire detectors removed and replaced.	Passing 300ft during descent, nr2 engine fire warning illuminated with associated fire bell. The engine was shut down iaw the emergency checklist and the warning extinguished as soon as the condition lever was selected to fuel off. A MAYDAY was declared and a single engine landing carried out. The aircraft then taxied onto stand and was inspected by the fire crew and engineers prior to passenger disembarkation. Engines and Wheel Wells inspected for fire and damage, none found. Fault code CDS-1500 indicates in-flight shut down. No other faults latched in the system. Fire detectors removed and replaced. System checked iaw AMM. Engine ground runs accomplished to confirm system status satisfactory. Fire detectors sent to Manufacturer for analysis where they passed the Manufacturer's acceptance check i.e. the alarm activated within 3 degrees of design target temperature.□ CAA Closure: The hazard is adequately controlled by the actions stated above.
200409039	10/12/2004	En route	North Sea (North Sea)	Southern	EGTT : London (FIR)	SIKORSKY	Turboshaft	2	PAN declared due to nr2 engine shut down. D & D alerted. Investigation found a small sliver on MPI 2. The engine oil was drained and refilled.	Shortly after the aircraft had lifted off from an offshore platform, the crew declared a PAN due to a nr2 engine malfunction and were instructed to select squawk 7700. Nr2 engine was then shut down and the aircraft continued to planned destination. Investigation found a small sliver on MPI 2. The engine oil was drained and refilled, engine vented for positive pressure. Oil filter inspected and cleaned. All other chip plugs inspected and found to be clean. Ground run carried out and returned to service.□ CAA Closure: The hazard is adequately controlled by existing requirements, procedures and documentation.
200409073	15/12/2004	En route	Caernarfon		EGTT : London (FIR)	BOLKOW	Turboshaft	2	High engine oil temperature indication. Nr1 engine shutdown.	During the return flight, following an uneventful HEMS mission, nr1 engine oil temperature increased to approx 120deg C. Oil pressure remained within limits but towards the lower end of the nominal scale sector. The nr1 engine was shutdown and the flight continued uneventfully to base. The nr1 engine oil temperature transmitter was subsequently replaced.
200409289	23/12/2004	En route			EGTT : London (FIR)	DE HAVILLAND	Turboprop	2	Nr1 engine shutdown due to low oil pressure warning. PAN declared and aircraft diverted to Gatwick.	Climbing through approx FL120 an intermittent master caution light was noticed with no accompanying caption. The climb stopped at FL160 and, due to strong headwinds, the aircraft descended to FL120. Subsequently the nr1 low oil pressure light began to illuminate intermittently, with an indicated pressure of approx 50psi. The QRH was actioned and the nr1 engine was brought into start feather, which appeared to resolve the problem. However, about 2-3 minutes later, the oil pressure light came on continuously. The nr1 engine was then shutdown, a PAN was declared and the aircraft diverted to Gatwick, where it landed safely with the AFS in attendance. The aircraft had recently returned from maintenance, having flown 3 hours since release to service. On initial inspection there appeared to be no oil remaining in the nr1 engine and very little evidence of oil escaping into the engine compartment, nacelle or fuselage. Rectification to a suspect oil leak from the propeller shaft cover plate was unsuccessful as the engine continued to use excessive quantities of oil on an intermittent basis. The engine was removed and returned to the OEM for investigation under warranty. The resulting strip report will be reviewed during the operator's powerplant review meetings.□ CAA Closure: The hazard is adequately controlled by the action stated above.
200500140	07/01/2005	En route			EGTT : London (FIR)	BAE	Turboprop	2	Nr1 engine low oil pressure warning. PAN declared, engine shut down and aircraft diverted to Norwich. Leak traced to a breach at the oil cooler outlet pipe, which was subsequently rectified.	Investigation revealed that the nr1 engine oil pressure warning was due to a loss of oil. This was traced to a leak at the oil cooler outlet pipe, which was subsequently rectified. No similar reports of oil leaks from this area. CAA Closure: The hazard is acceptable provided the frequency remains low.
200500198	12/01/2005	En route	Isle Of Man (IOM)		EGTT : London (FIR)	MCDONNELL DOUGLAS	Turbofan	3	PAN declared and precautionary descent carried out due to failure of one engine. Flight continued to destination.	
200500267	13/01/2005	Approach	Exeter		EGTT : London (FIR)	PIPER	Reciprocating	1	MAYDAY declared due to engine failure. Aircraft landed safely with emergency services in attendance.	
200500273	13/01/2005	Approach	Oxford		EGTT : London (FIR)	PIPER	Reciprocating	1	Engine failed on final approach at 230ft / 75 kts. Glide approach and landing completed. Engine re-started following landing. No engine faults found. Suspected carburettor icing.	
200500530	24/01/2005	En route	Manchester (MCT)		EGTT : London (FIR)	BAE	Turboprop	2	LH engine shut down due to fluctuating oil pressure during descent. MAYDAY declared. Uneventful landing at destination. Oil Pressure Transducer was replaced. Strip report requested.	Following Engineering defect investigation, the nr1 Oil Pressure Transducer was replaced. Engine ground runs carried out and aircraft released to service. After a month, and over 90 hours of operations, there has been no recurrence of this defect. A strip report has been requested for the removed Oil Pressure Transducer.□ CAA Closure: The hazard is adequately controlled by the actions stated above.

200500612	24/01/2005	Approach	Manchester (MCT)		EGTT : London (FIR)	BAE	Turboprop	2	LH engine in-flight shut down due to loss of oil pressure. Emergency declared. Oil transducer fault.	The aircraft was operating with an outstanding ADD for fluctuating oil pressure on the LH engine, although oil pressures had been normal during the previous sector. On the subject sector the oil pressures were again normal until the approach when the LH oil gauge began fluctuating +/- 10psi. The situation was monitored but after approx 2 minutesthe fluctuations became unstable with a tendency towards low-pressure indication. Shortly afterwards the fluctuations ceased and the oil pressure dropped to 20psi. It was also noted that the temperature was much higher on the LH engine than the RH engine. The 20psi indication remained stable and despite no "Low oil pressure" warning it was decided to shut down the LH engine. An emergency was declared and the LH engine was shut down iaw SOPs. An uneventful landing was then carried out with the fire services in attendance. An oil transducer was subsequently replaced and the aircraft released to service with no recurrence of oil pressure fluctuations. The reporter confirms that the temperature difference between the two engines was just coincidental. As per the original report, the number 1 Oil PressureTransducer was replaced and engine ground runs carried out with the aircraft released to service. After a month andover 90 hours of operations, there has been no recurrenceof the reported defect. A strip report has been requestedfor the removed Oil pressure transducer.
200501057	30/01/2005	Take-off	Hucknall		EGTT : London (FIR)	CESSNA	Reciprocating	1	Engine failed. Forced landing on aerodrome. Carburettor malfunction.	During a climb following two uneventful circuits at Hucknall, there was a noticeable and significant loss of power.With the throttle fully open, an engine speed of 2000rpm was recorded. After checking fuel quantity, magnetos, primer, mixture and carburettor heat, the instructor tried pumping the throttle slowly but this caused the engine to shut down. A successful forced landing at Hucknall aerodrome followed, with the aerodrome fire services in attendance. During subsequent investigation, another carburettor was removed from a serviceable aeroplane and full power was restored with normal engine parameters noted. Due to high hours on the engine, the engine and carburettor were removed pending overhaul.
200501140	20/02/2005	En route	Manchester (MCT)	Nr	EGTT : London (FIR)	BOEING	Turbofan	4	Nr2 engine shutdown due surge/overtemp on take off. MAYDAY declared approaching destination due low fuel state. A/cdiverted to Manchester. AAIB Field investigation.	AAIB Bulletin 06/2006, ref: EW/C2005/02/04 - Summary: Immediately after the aircraft took off on a night flight from Los Angeles to London, a banging sound was heard and passengers and ATC reported seeing flames from the Nr2 engine. The symptoms and resultant turbine over-temperature wereconsistent with an engine surge; the crew completed the appropriate checklist, which led to the engine being shut down. After assessing the situation, and in accordance withapproved policy, the commander decided to continue the flight as planned rather than jettison fuel and return to Los Angeles. Having reached the East coast of the USA with no indications of further abnormality and with adequate predicted arrival fuel, the crew decided to continue to the UK. The winds and available flight levels were subsequentlyless favourable than anticipated and, nearing the UK, thecrew decided to divert to Manchester in order to maintainthe required arrival fuel reserve. In the latter stages of the flight, the crew encountered difficulties in balancing the fuel quantities in the four main tanks. They becameconcerned that the contents of one tank might be unusableand declared an emergency in accordance with the operator's procedures. The aircraft landed with low contents in both outboard main tanks, although the total fuel quantity was in excess of the planned reserve. The fuel system, in the configuration selected, should have continued to feed the operating engines until all tanks emptied. The investigation determined that the engine surge had been due to excessive wear to the high-pressure compressor casing and, with the standard of fuel controller software installed, this resulted in turbine over-temperature damage. There was no evidence of fuel system malfunction and it was possible to maintain fuel tank quantities in balance by the selective use of fuel pumps. The evidence suggested that the operator should ensure that flight crews are provided with relevant instruction on 3-engined fuel handling during initial and recurrent training and that the regulators should review the policy on flight continuation for public transport aircraft operations following an in-flight shutdown of an engine, in order to provide greater clarity to the operators. Eight recommendations are made (2006-018, 2006-19 and 2006-022 to 2006027 inclusive), six of which relate to flight data recorders and two of which are addressed to theUK CAA. See also 200407768 and 200501377.□ CAA Closure: CAA FACTOR F23/2006, detailing the CAA responses to the eight AAIB Safety Recommendations, was issued on 11 August 2006. Any further CAA action required will be progressed via the 'Annual Review of AAIB Recommendations' procedure.
200501223	18/02/2005	En route	NITON	Nr	EGTT : London (FIR)	BAE	Turboprop	2	LH engine shut down due to power lever jam during descent((OAT -40deg). PAN declared. Power lever cable may have been frozen.	Uneventful single engine ILS landing carried out and after landing the LH power lever restriction disappeared. Engineering investigation did not reveal any obvious problem however the power lever cable was replaced and aircraft released into service with no further reports since. The operator believes the cable may have been affected by water ingress into the sheathed cable which subsequently froze during the flight - water seeping into the cable eye end at the 'up' end of the cable run. The nut at this eye end has a Nylock insert presumably to reduce the risk of fluid ingress. The operator, through an 'Engineering Technical Requirement' has since decided to introduce replacement of these Nylock nuts every 3000 hours on both the power lever cables and also the RPM levers (previously they were replaced every 6000 hours). The affected cable was routed to BAe Systems for investigation. □ CAA Closure: The hazard is adequately controlled by the action stated above.
200501479	01/03/2005	En route	London-Gatwick - LGW		EGTT : London (FIR)	AIRBUS	Turbofan	2	Engine FADEC parameter loss.	Nr1 engine suffered FADEC channel failure when climbing through FL150, resulting in all engine parameters being lost. Successful engine relight with return of parameters. Aircraft returned to departure airport for an uneventful overweight landing. EEC changed and the aircraft departed with no recurrence. Investigation being progressed under 200408419.
200501563	04/03/2005	Take-off	Bournemouth		EGTT : London (FIR)	DORNIER	Turboprop	2	Electrical failure to the RH side of the cockpit. Circuitbreaker (c/b) BW2 cracked.	During climb out during a C of A renewal flight test, thecaution annunciator illuminated with a corresponding pilot caption on the annunciator panel. This was immediately followed by a total electrical failure to the RH side of the cockpit, including the intercom, radio and RH engine instruments. A precautionary shutdown was carried out on the RH engine and the aircraft returned to the departure airport. Fault investigation found a tripped 80 Amp c/b BW2 which controls the Nr 2 busbar. Further investigation found the subject c/b (425-K14-LN2-80A) cracked and when reset, the pull of the cable on the output terminal was sufficientto trip the c/b due to the side load. As a precaution another fleet aircraft was checked and the BW2 C/B was also found to be cracked. The subject c/b are attached to heavy gauge cables consequently movement of the hinged panels for access unavoidably applies pressure via the cables to the c/b terminals. The OEM has been informed of this failuremode and Aircraft Maintenance Schedule (AMS) has been amended calling for an inspection to prevent recurrence. □ CAA Closure: No further CAA action is practicable.
200501718	10/03/2005	En route			EGTT : London (FIR)	HAWKER SIDDELEY	Turbofan	2	Aircraft failed to follow SID on departure. PAN declared due to "Nav Kit Failure". PAN declared a second time for single engine failure. Aircraft diverted.	Having departed on a CLN5T SID and squawked ident, ATC noted the aircraft turn was far inside the SID track. ATC issued a heading to avoid traffic on final approach but it was then realised the turn was far deeper towards final approach, requiring ATC to issue avoiding action with information passed to inbound traffic. PAN then declared due to "Nav Kit failure" although the aircraft decided to continue with the flight. The aircraft then called frequency stating he wished to divert to Luton. PAN declared a second time due to single engine failure. See also 200306643, 200308003, 200408118, 200408385, 200609574, 200609904, 200600587, 200610520 and 200610549
200502423	03/04/2005	En route			EGTT : London (FIR)	OTHER	Unknown		Suspected fuel leak. Engine shut down. MAYDAY declared and aircraft returned to departure airport.	
200502499	07/04/2005	En route	North Wall (Durham)		EGTT : London (FIR)	CESSNA	Turboprop	2	RH engine shut down when anti-ice light failed to extinguish. Ant-Ice valve failure suspected.	Whilst periodically using engine anti-ice in cruise, the RH engine anti-ice light failed to extinguish when selected off. It was suspected that the RH anti-ice valve had failed in the open position. Due to POH limitation on the use of engine anti-ice above +4deg C, the RH engine was shut down and an uneventful single engine approach and landing was carried out.
200502615	07/04/2005	En route	Teesside (TD)		EGTT : London (FIR)	BAE	Turboprop	2	LH power lever linkage jammed during descent. Engine shutdown. Icing suspected. Engineering investigation could not reproduce the defect on the ground.	On starting the descent, the LH power lever linkage jammed with the engine at 75% torque. Unable to determine causebut icing suspected. Engine shutdown and uneventful landing carried out. The power lever operated normally after landing. Engineering were unable to reproduce the defect on the ground and believe icing of the control cable as the probable cause (as experienced previously - Ref MOR 200501223).The operator's maintenance programme includes lubrication of the cables at the pressure seals every 1800 hours (every 3E check). They have also introduced an engineering technical requirement to replace the Nylor nuts at the cable ends every 3000 hours, previously every 6000 hours, in an attempt to reduce the possibility of moisture ingress at the cable ends. In addition, this problem has been subject of discussion between the cable manufacturer and aircraft manufacture who are reviewing this problem. Aircraft released back into service and flown without further occurrence of this defect.□ CAA Closure: The hazard is adequately controlled by the actions stated above.
200502642	11/04/2005	En route	Birmingham		EGTT : London (FIR)	BAE	Turbofan	4	PAN declared due to problem with nr2 engine. Aircraft diverted to Birmingham.	
200502847	13/04/2005	En route	Leeds Bradford (LBA)	12 S E	EGTT : London (FIR)	BOLKOW	Turboshaft	2	PAN declared with one engine shutdown. Aircraft landed safely. Investigation revealed that the engine shut down, as it should, due to a magnetic chip detector (MCD) warning.	Investigation revealed that the engine shut down, as it should, due to a magnetic chip detector (MCD) warning. Maintenance carried out in accordance with OEM requirements, fine dust found on chip, within limits for further operation. Detector cleaned and refitted. Approximately 2 months later, this engine was removed from service following another MCD warning. This time MCD findings were outside limits. MCD monitoring system has operated as intended to indicate engine deterioration. See also 200204108.□ CAA Closure:No further CAA action required at this time.
200502927	21/04/2005	En route			EGTT : London (FIR)	FOKKER	Turboprop	2	PAN declared with one engine shutdown. Aircraft diverted to Stansted.	
200502936	21/04/2005	En route	Cranfield (CIT)	10nm SW	EGTT : London (FIR)	GRUMMAN	Reciprocating	2	RH engine failed to restart after in-flight shutdown for training purposes. PAN declared. Aircraft returned and landed safely.	Starter motor failed.

200502950	24/04/2005	En route	Abergele		EGTT : London (FIR)	EUROCOPTER	Turboshaft	2	Nr1 ECU engine chip caption illuminated. Checklist actioned and engine shutdown. PAN declared. Run on landing carried out at base.	A small sliver of debris was recovered from the forward oil tank chip detector. Ground run/air test completed with satisfactory results and aircraft returned to service.
200503209	29/04/2005	En route	Teesside (TD)		EGTT : London (FIR)	OTHER	Reciprocating	1	Smoke in cockpit and engine failure, although power regained during return to departure airport. Aircraft landed safely with fire services in attendance.	
200503303	06/05/2005	Take-off	London-Heathrow - LHR		EGTT : London (FIR)	AIRBUS	Turbofan	2	Nr2 engine stall on application of flex thrust during take-off. The HP compressor became damaged due to a stage 3 blade failure; the engine has been repaired and is now backin service.	During taxi out, all indications were normal. However, onapplication of flex thrust, unusual noises were heard, nr2 engine EGT fluctuated and the aircraft started to yaw tothe right. As the thrust levers were retarded, a brief ECAM "ENG 2 stall" warning was displayed, which then disappeared at idle. The thrust levers were retarded to idle by 40kts and aircraft taxied off the runway and brought to a halt. At idle, nr2 engine parameters were normal but the engine was shut down as a precaution - aircraft returned to stand. Investigation found that the HP compressor damage was due to a stage 3 blade failure. The stage 3 blade had failed through the aerofoil at approximately 20mm above theplatform at the leading edge and was caused by high cyclefatigue. The origin was associated with an area of pre-existing damage which occurred some time previously and had caused flattening of the concave leading edge. All other damage was considered secondary as a result of the blade failure. The engine was repaired and is now back in service.As a result of the above finding, the operator initiated a fleet check to borescope all engine stage 3 blades. As aresult, one other engine exhibited signs of damage on oneblade and this was kept 'on watch' every 600 hrs. This engine has now been scheduled off wing and sent to the OEM for repair. Since the event SB 72-496 has been issued, which requires a stage 3 inspection every 750 hours for those engines in excess of 5000 hours. The operator has implemented this inspection. See also 200609742.☐ CAA Closure: Thehazard is adequately controlled by the actions stated above.
200503982	30/05/2005	Approach	Gloucester-Staverton		EGTT : London (FIR)	EUROCOPTER	Turboshaft	2	Automatic engine shutdown by overspeed protection system.	At a late stage on the approach to a hover landing, with the nr1 engine set to manual control, the pilot did not sufficiently control the nr1 engine to prevent an First Limit Indicator (FLI) mismatch (nr2 engine was indicating 10 and nr1 engine 5). In an effort to reduce the power demand on the nr2 engine, the nr1 engine was accelerated by advancing the twist grip out of the neutral detent. It then became apparent that a hover landing could not be achieved soa low speed run on landing was made. During the run on itappeared that the nr2 engine was still indicating high onthe FLI. The pilot states that, although it was not possible to recall all the power indications exactly during therun on landing, he obviously lowered the collective without sufficiently throttling the nr1 engine, resulting in the overspeed protection system shutdown. Nr1 engine replaced iaw manufacturer's requirements. See also 200507611.
200504233	31/05/2005	En route	Darlington		EGTT : London (FIR)	EUROCOPTER	Turboshaft	2	Nr1 engine chip caption illuminated in cruise. PAN declared. Engine shutdown. Aircraft returned and an uneventful single engine run on landing carried out.	Small amount of debris found on the forward mag plug. Plugs cleaned/refitted, oil system drained and replenished and oil filter inspected. Ground run carried out - satisfactory. Oil system again flushed, filter inspected and an independent 'A' check carried out - satisfactory. See also 200502992.
200504378	10/06/2005	En route	Exeter	5 S E	EGTT : London (FIR)	EUROCOPTER	Turboshaft	2	Nr1 engine chip caption illuminated. Checklist actioned, fuzz burner activated but warning persisted engine shutdown. PAN declared. Aircraft returned.	MCD removed, one small hair like particle found. Oil system drained and replenished, oil filter inspected - no debris found. Ground run carried out and oil system again drained and replenished. The reporter cites a similar occurrence on this aircraft and the distress of the oil breather magnetic seal. It is considered likely that this instance of chip detection is a spurious indication related to that incident. In addition, this report also covers the occurrence of a similar, related event on the same aircraft, the previous day. See also 200504784 and 200503513.
200504553	06/06/2005	En route	Halifax		EGTT : London (FIR)	BOLKOW	Turboshaft	2	Nr2 engine mag plug caption illuminated. Chip pulse activated but caption persisted. Engine shutdown, aircraft returned and landed safely.	Engine gearbox magnetic plugs inspected, paste and fine particles removed, plugs re-fitted and ground run carried out with satisfactory results. Thus there were no indications of an internal failure and the aircraft was returned toservice.
200504738	09/06/2005	En route	Dorchester	2nm W	EGTT : London (FIR)	MD HELICOPTER	Turboshaft	2	LH engine flamed out due to fuel starvation. Ejector pumpblocked.	In the cruise, the LH low fuel 'Tick' mark was seen to beflashing with fuel contents indicating 265lbs. Decision was taken to return to base. It was later noted that the IIDS was showing indications of an intermittent left boost pump failure and a LH engine 'GEN' caption. The RH engine torque indication was also observed to be in the red sector. The collective was lowered to bring the RH engine withinOEI limits and the LH engine was diagnosed as having failed and was shutdown. A precautionary single engine landingwas carried out, maintaining the RH engine well within limits. On landing, the fuel gauge indicated 170lbs. Engineering investigation found the nr2 (RH) ejector pump blocked. This is a venturi style pump, which transfers fuel from one side of the fuel cell to the other. The nr1 (LH) ejector pump was still operating and this resulted in fuel being transferred to the RH side of the fuel cell. As a resultthe LH side ran sufficiently low to cause the engine flame out. An analysis of the debris blocking the nr2 ejector pump is to be carried out. EASA are responsible for ensuring the continued airworthiness of the MD900 and EASA have been informed of the reported problem. CAA have proposed modification of the fuel system to incorporate screens to the jet pump inlets to preclude failure caused by debris inthe fuel tank. EASA are continuing discussions with the manufacturer MDHI and FAA to pursue this modification and any AD action required. See also 200009412 and 200108288.☐ CAA Closure: No further CAA action practicable.
200505061	29/06/2005	En route	Northampton Sywell	5 S E	EGTT : London (FIR)	PIPER	Reciprocating	2	Nr2 engine vibration in the cruise. Engine shutdown. Aircraft returned and uneventful landing carried out.	
200505151	02/07/2005	En route	Brecon (BCN)	15nm NE	EGTT : London (FIR)	ATR	Turboprop	2	MAYDAY declared with one engine shutdown. Precautionary descent. Aircraft diverted to Cardiff and landed safely.	
200505338	05/07/2005	En route	Compton (CPT)		EGTT : London (FIR)	OTHER	Unknown		Aircraft returned with one engine shutdown following firewarning.	
200505428	06/07/2005	En route	Henstridge	8 S W	EGTT : London (FIR)	BOLKOW	Turboshaft	2	Nr1 engine chip warning. Engine shutdown. PAN declared. Flight continued to base and a single engine approach and landing carried out.	Fine hair like splinter approx 2.5mm in length found on the lower chip detector. Oil changed, filter element replaced, chip detector cleaned/refitted and 30 minute ground run carried out satisfactory.
200505665	15/07/2005	En route	Bovingdon (BNN)		EGTT : London (FIR)	AIRBUS	Turbofan	4	Nr3 engine fuel filter 'CLOG' advisory followed by nr4 engine vibration indication of 3.5 units accompanied by airframe vibration and acrid fumes at rear of cabin. PAN declared on arrival.	The aircraft was positioning to LHR following a 'C' check. During climb, a nr3 engine fuel filter 'CLOG' ECAM advisory appeared. Also, nr4 engine vibration indicated 3.5 units accompanied by airframe vibration and an acrid smell atrear of cabin. Nr4 EGT indicated 15-20deg C higher than other engines. PAN declared for priority approach to LHR. Nr4 engine shut down after landing and fire service inspection carried out with no defects apparent. Investigation, including inspection of the nr3 engine fuel filters found no debris but the filters were replaced as a precaution. During a subsequent ground run, a heavy oil leak was detected from under the RH core cowl above the transfer gearbox.This oil leak was traced to oil vent pipe p/n FW19976. Gasket p/n AGS3896 was replaced but after a further ground run there was still evidence of a minor leak. However, after consultation with the engine manufacturer and another ground run, the nr3 engine was assessed as serviceable. During the 'C' check, the nr4 engine fan blades were changed and, although within manual limits, the associated trim balance required a larger number of balance weights than would normally be expected. It is believed, but not confirmed,that this could have been due to the new fan blades not being installed iaw the build pattern supplied. Consequently, the subsequent vibration run showed vibration to be high but within limits. Post incident checks revealed the nr4engine fan to be out of balance. A further trim balance and vibration survey was carried out and no additional incidents of vibration have been recorded. Unable to reproducethe acrid smell in rear galley with packs supplied from APU or engines. Please note that the subject engine was replaced for an engine oil leak unrelated to this MOR and notapparent during flight.☐ CAA Closure: The hazard is adequately controlled by existing requirements, procedures and documentation.
200505669	14/07/2005	En route	Aintree		EGTT : London (FIR)	EUROCOPTER	Turboshaft	2	Engine chip caption.	Nr1 engine chip caption activated in the cruise. Fuzz burner operated with no effect. PAN declared and the engine was shut down prior to an uneventful single engine landing.Airport standby initiated. Investigation found a fine hair like particle on the forward magnetic chip detector. Satisfactory ground run carried out and the aircraft was released to service.
200505699	16/07/2005	En route	Durham Tees Valley (TD)		EGTT : London (FIR)	SHORT	Turboprop	2	LH engine began to surge uncontrollably during descent. Engine shutdown.	Investigation established that the autofeather microswitches were out of adjustment. Suitable adjustments made and extensive ground runs carried out with satisfactory results.
200505722	15/07/2005	En route	Manchester (MCT)		EGTT : London (FIR)	BAE	Turboprop	2	Engine failure in flight. MAYDAY declared. Diversion. Right hand engine fuel control unit was not metering fuel accurately, causing overfueling.	Fluctuations in RH engine RPM and torque with increasing EGT and erratic fuel flow noted. The RH power lever was retarded but EGT still registered 660deg and when the Top Temperature Control (TTC) was turned off, RH EGT reached 770deg. A MAYDAY was declared and the engine shut down, following which the LH oil pressure was seen to be high with LHhydraulic pump fluctuations. Diversion to Manchester initiated. Investigation conducted by the operator found the right hand engine fuel control unit was suspected as not metering fuel to the engine causing an overfuel situation. The FCU was replaced and the aircraft returned to service. The FCU was returned to its manufacturer who confirmed by strip report that the damage was caused due to the gear shearing off the bottom of the ballhead. The OEM also confirmed that there have been a small number of gear separations and as a result they have introduced an improved welding process. The operator has confirmed that this standard has been specified on their engine work scope, thereforeappropriate follow-up actions have been initiated. Previous MORs 200307952 and 200400151 have been identified as being unrelated to this occurrence.☐ CAA Closure: The hazardis acceptable provided the frequency remains low.

200505787	18/07/2005	En route	Farnborough	Nr	EGTT : London (FIR)	PIPER	Reciprocating	2	Fuel feed problems experienced with both engines during return to Blackbushe due to weather. Nr1 engine shutdown. Diverted to Farnborough and landed safely.	The operator confirmed that the fuel starvation was caused by an inadvertant selection of the fuel cock in the incorrect position. This event was not related to any maintenance error or aircraft defect. □ CAA Closure: The hazard isadequately controlled by existing requirements, procedures and documentation.
200506200	02/08/2005	En route	Manchester (MCT)		EGTT : London (FIR)	AIRBUS	Turbofan	2	Nr1 engine in-flight shut down due to oil pressure loss. Fuel dumped. Aircraft returned. The root cause was the breather gearshaft ball bearing outer race retaining studs working loose. SB issued.	During flap retraction on climb out, it was noted that the nr1 engine oil quantity was "pulsating" on the ECAM. Shortly afterwards, the oil pressure began to drop from the normal range and once pressure dropped below the critical level, a Level '3' continuous repetitive ECAM master warning was triggered. The nr1 engine was subsequently shut downand the aircraft entered the MIRSI hold where approx 40 tonnes of fuel was dumped. Following completion of the fueldumping procedure the aircraft was prepared for an ILS approach to R/W 06R at MAN and the overweight landing checklist was completed. A single engine approach and landing was carried out without the use of autoland. The engine was removed and investigated at the operator's facilities by representatives of the engine OEM. The master MCD and oil filter were heavily loaded with gear steel flakes/slivers. Borescope inspection found breather / 70T gear damage. Theroot cause was the breather gearshaft ball bearing outer race retaining studs working loose and being released; the studs had worked loose due to shear-loading on anti-rotation keys. For in-service management, a non-modification Service Bulletin SB72-E842 has been published instructing inspection checks to the self locking nuts and key locked studs. A review of new build and overhaul repair shop procedures has been conducted. See also 200305230.□ CAA Closure: The hazard is acceptable provided the frequency remains low.
200506263	01/08/2005	En route	LFA 9 (Western)		EGTT : London (FIR)	BELL	Turboshaft	2	Engine rotor rpm and torque oscillations/mismatch during recovery from practice autorotation. Automatic Flight Control Unit (AFCU) changed.	During normal recovery from an autorotation (70kts, levelaltitude) engine response was initially slow, triggering the NR warning horn. When the engines responded, they did so harshly, resulting in oscillations of the rotor rpm andtorque with some torque mismatching. Lever raising was temporarily halted whilst the oscillations receded (after approx 3 or 4 cycles). No readings were taken from the ITT or N1 gauges. The crewman reported three "popping" sounds from the engines (thought to be from nr1 engine) whilst theNR fluctuated. No further autorotations were attempted and the aircraft was recovered to base. No defects found during extensive investigation/troubleshooting of both enginepower sections/transmissions/gearboxes and all subsequentground runs/leak checks satisfactorily completed. Aircraft released for flight test and during first and second autorotation checks no faults were apparent. However, during the third attempt a muffled thud was heard followed by a sharp increase in nr 2 Power Section ITT with engine torquesplits and a rapid decay of NR. The reporter confirms that indications were indicative of engine stall/surge. Aircraft grounded pending further investigation. Following inspection of the 42-degree gearbox, the AFCU was replaced. Additionally, the bleed closing point and associated pneumatic pipelines were inspected, with subsequent ground runs and airstest satisfactory. See also 200502706.□ CAA Closure:The hazard is adequately controlled by the actions statedabove.
200506358	06/08/2005	Take-off	London-Gatwick - LGW		EGTT : London (FIR)	BOEING	Turbofan	2	Nr1 engine slow to reach take-off power. nr2 engine exceeded take-off N1 by approx 5% then stabilised at 87%. PAN declared for single engine landing.	Power was set on both engines at 87% by 80kts and take-off continued. At acceleration, N1 engaged and nr1 engine started to hunt +/- 10%. Autothrottle was disengaged and manual power climb and cruise carried out. During early descent, simulated TOGA power was applied on the throttles, nr1engine remained at idle power with nr2 engine at approx 70%. The crew discussed the options/ramifications and a single engine approach and landing was decided upon with nr1 engine at idle power. PAN declared and a normal single engine approach and landing was carried out law standard operating procedures. Operator investigation revealed that theengine VS/s were not rigged correctly. After being riggedcorrectly, there was no recurrence.□ CAA Closure: No further CAA action required at this time.
200506451	09/08/2005	En route			EGTT : London (FIR)	EUROCOPTER	Turboshaft	2	Nr2 engine oil pressure warning illuminated in flight.	Nr2 engine oil pressure warning fell to below 1.3 bar after approximately 5 minutes of flight. VEMD caption illuminated although no CAD warning activated. PAN declared, nr2 engine shut down and a single engine landing completed at base. Nr2 engine oil pressure transmitter subsequently replaced.
200506488	10/08/2005	Take-off	Nottingham East Midlands		EGTT : London (FIR)	BOEING	Turbofan	2	Bird strike.	Bird strike on take off. Engine shut down, MAYDAY declared and aircraft returned to departure airport. Full emergency declared and aircraft landed safely. Full runway inspection carried out before and after landing.
200506853	22/08/2005	En route			EGTT : London (FIR)	FOKKER	Turboprop	2	PAN declared with one engine shutdown. Flight continued to intended destination.	See also 200502927.
200506888	21/08/2005	En route	Manchester Barton A/F	1.5nm NW	EGTT : London (FIR)	OTHER	Reciprocating	1	MAYDAY declared due to engine failure. Aircraft landed ina field. RFS alerted. No injuries or damage to aircraft.	
200507045	21/08/2005	En route	SLANY		EGTT : London (FIR)	BOEING	Turbofan	4	PAN declared due to nr1 engine loss and undisclosed hydraulic problem. Aircraft returned. Fault traced to failure of an hydraulic pump seal, which caused loss of fluid and ingress to the engine.	Supplementary information revealed that, in cruise, EICASmessages 'HYD press', 'HYD qty low 1', 'Eng Oil filt' and'Eng 1 oil press' occurred sequentially. The crew shut down the nr1 engine. Consequent laboratory analysis of a sample of the engine oil revealed that it was contaminated with an excessive quantity of Skydrol. External examination of gearbox revealed a quantity of small chunks of copper coloured debris in the cavity adjacent to where the hydraulic pump is normally installed. It is considered that a leak from the failed hydraulic pump would easily overcome thesealing capability of the air blown gearbox seal allowinghydraulic oil to enter the engine oil system. Due to extensive damage to the hydraulic pump, which had run dry for a considerable time, it was not possible to establish the root cause of failure. It can only be assumed there may have initially been a failure of the pump input shaft seal which caused the hydraulic fluid to enter the engine. Pump reliability is generally good and such pump failures are rare according to the subject operator's reliability data.CAA Closure: The hazard is acceptable provided the frequency remains low.
200507369	07/09/2005	En route	En Route		EGTT : London (FIR)	BOEING	Turbofan	4	Nr2 engine shut down due to zero oil pressure, with associated EICAS message. Calculations indicated arrival at destination with 2000kgs of fuel remaining. PAN later declared due to fuel shortage.	Investigation concluded that this report was a matter of interpretation: the aircraft actually shut down with 6300 kgs of fuel in its tanks. This consisted of 4300kgs reserve fuel plus 2000kgs. Company procedures were followed. Seealso 200501140.□ CAA Closure: The hazard is adequately controlled by existing requirements, procedures and documentation.
200507510	12/09/2005	En route	Liverpool		EGTT : London (FIR)	BAE	Turboprop	2	RH engine shutdown due to oil pressure warning. PAN declared, aircraft returned and landed safely. Investigation found a a crack in the Fuel Cooled Oil Cooler.	Investigation found the engine contaminated with fuel, caused by a crack in the Fuel Cooled Oil Cooler. FCOC replaced with an improved type in accordance with an availableSB.□ CAA Closure: The hazard is adequately controlled by the actions stated above.
200507691	14/09/2005	En route	Wattisham		EGTT : London (FIR)	OTHER	Other		PAN declared due to gearbox warning and associated engineshutdown. Aircraft returned and landed safely with AFS inattendence.	The aircraft's initial call went unanswered by approach due to an UHF equipment failure on the ground. Another company aircraft acknowledged the call and the subject aircraft re-transmitted his emergency call to the Tower. ATC reported that throughout the emergency, radio traffic was highdespite issuing a 'minimise' call.
200508000	23/09/2005	En route	Caerphilly		EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	2	RH engine chip detector warning during flight. Aircraft returned. RH engine magnetic plug contaminated with FOD.	At 1600ft agl during cruise, the RH engine chip warning light illuminated. ATC were advised but no emergency declared. Safe single engine flight conditions obtained and the engine was shut down iaw the checklist. The aircraft then returned and a single engine approach and running landing was carried out with the emergency services in attendance.During subsequent engine inspection, a 'sliver' was foundwhich was confirmed to be within acceptable limits iaw the engine manufacturer's maintenance manual. The magnetic chip plugs were re-secured, oil levels replenished and an engine ground run satisfactorily carried out with no recurrence of warning. Aircraft considered fit for service. See also 200507473 (similar incident, same aircraft, same engine). Engine subsequently changed having failed to meet thecontinued service criteria of no more than four chip warnings within 50 flight hours.□ CAA Closure: The hazard is adequately controlled by existing requirements, procedures and documentation.
200508021	01/09/2005	Take-off	Bristol Filton		EGTT : London (FIR)	EUROCOPTER	Turboshaft	2	Engine chip warning during initial climb.	Nr2 engine chip warning illuminated during the initial climb. Fuzz burner operated to no effect. Nr2 engine shut down IAW flight manual followed by a single engine approach and landing. Metal flakes removed and sent to the engine manufacturer for analysis, who ascertained one of the forward magnetic seals was breaking down. All three magnetic seals replaced with the starter generator seal found damaged. No further particles found during subsequent inspection.See also 200404346 and 200603074.
200508027	13/09/2005	En route			EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	2	Engine chip warning.	During transit to base, LH engine chip warning activated,then briefly cleared before illuminating again. Use of 'Chip Pulse' switch failed to clear caption. Power reduced for safe single engine flight to base. Chip pugs removed and a drain/flush carried out. After 30 minute hover, a small quantity if debris was again evident. The aircraft returned to its maintenance base where more debris was found. ECU removed for repair.

200508036	26/09/2005	En route	Polehill (POL)		EGTT : London (FIR)	BOEING	Turbofan	2	Engine shut down and aircraft descended due to icing problem. PAN declared and diverted to Manchester. Investigation traced the fault to a faulty over-temperature switch.	Operator investigation revealed that there had been several reported engine anti-icing problems of an intermittent nature. Repeated attempts were made to fault find this defect without success. Several components were replaced, the last one being the over-temperature switch, which cured the defect. ☐ CAA Closure: The hazard is adequately controlled by the actions stated above.
200508098	29/09/2005	En route	Polehill (POL)		EGTT : London (FIR)	BAE	Turbofan	4	Nr3 engine shut down due to oil quantity/pressure loss. Diversion. PAN declared. Fuel burnt off. Investigation traced the fault to nr 3 engine 3 oil scavenge pump.	During cruise nr3 engine oil quantity was noted to be zero with oil pressure falling slowly towards the 'red line' (and also large fluctuations). The company was contacted and a decision made to divert to Manchester. With the oil pressure close to the 'red line' (but prior to a low pressure warning) the nr3 engine was shut down and a PAN declared, which was later cancelled when the drills were completed. The aircraft was held for 15 minutes to reduce weight to maximum landing weight. An uneventful 3-engine landing was carried out with emergency services in attendance. Subsequent investigation revealed that there was no oil in nr3 engine. Engineering investigation led to the replacement of nr 3 engine 3 oil scavenge pump. ☐ CAA Closure: No further CAA action required at this time.
200508248	05/10/2005	En route	London-Heathrow - LHR	10 W	EGTT : London (FIR)	BOEING	Turbofan	4	AAIB Initial Notification: Another aircraft observed sparks coming from the B747. Aircraft returned. PAN declared due to a problem with the nr1 engine.	Loud bang heard and sparks seen from nr1 engine on rotation. Departure completed. Fuel jettisoned prior to return to departure airport. Multiple engine surges on approach with EGT indication in excess of 700deg and rising. Engine shut down and three engine landing completed. Following landing, nose wheel steering failed resulting in the aircraft being unable to vacate the runway. The reporter adds that with nr1 hydraulic pump being unserviceable under an ADD, the engine shutdown resulted in total loss of nr1 system. Investigation found that the engine had suffered two previous lesser surge events before this report. Inspections and tests did not reveal any defects but after the second event the VIGV controller was replaced. Flight and trend monitoring data was assessed before return to service. Subsequently, the engine operated normally for two sectors, until this event. The root cause of failure was found to be a combination of stage 2 liner loss and HPC front case "birdmouth" wear. This had caused excessive tip clearances in the HP compressor and this can result in engine surge. This is a known problem and the engine manufacturer has been working on a suit of modifications to address this issue, including a trend monitoring prediction method to predict if an engine is at risk. With respect to the loss of nose wheel steering and the inability of the aircraft to steer off the runway following this incident was due to the non-availability of nr1 hydraulic system. The aircraft had been previously dispatched with the nr1 ADP inoperative, in accordance with the MEL. Following the nr1 engine being shut down on approach, this caused the further loss of nr1 EDP. ☐ CAA Closure: The hazard is adequately controlled by existing requirements, procedures and documentation.
200508298	07/10/2005	En route	Isle Of Man (IOM)	10 S E	EGTT : London (FIR)	DE HAVILLAND	Turboprop	2	MAYDAY declared with nr2 engine shutdown due to oil pressure warning. Aircraft diverted to Belfast International and landed safely. Investigation found the low oil pressure switch defective.	Engineering investigation revealed the low oil pressure switch was defective. The switch was replaced IAW AMM 79-31-00 and ground engine runs accomplished satisfactorily. A reliability review was accomplished and no reliability issues were identified across the subject a/c fleet. ☐ CAA Closure: The hazard is adequately controlled by existing requirements, procedures and documentation.
200508425	09/10/2005	En route			EGTT : London (FIR)	LOCKHEED	Turboprop	4	PAN declared with one engine shutdown. Aircraft diverted to Mildenhall.	
200508507	15/10/2005	En route	Blackpool (BPL)		EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	2	During climb to carry out maximum ng check following nr1 engine change, nr1 engine chip warning illuminated. Engines shut down and aircraft returned to base where full emergency declared.	
200508682	17/10/2005	Take-off	Warton		EGTT : London (FIR)	DASSAULT	Turbofan	2	Birdstrike: Aircraft struck a number of birds on rotation, resulting in nr2 engine rundown. Engine subsequently relit and flight continued.	Damage to first stage rotor blade. Engine replaced.
200508771	25/10/2005	En route			EGTT : London (FIR)	DE HAVILLAND	Turboprop	2	Nr2 engine rundown during climb. PAN declared. Aircraft returned and landed safely. Fault traced to nr 2 EEC, which was replaced.	Passing FL190 for cleared level FL200 in day IMC, uncommanded yaw was evident and nr2 engine torque indication decreased rapidly. A PAN was declared to ATC. The reporter notes no indication of nr2 engine automatic relight. ORH drill 1.6 for engine shutdown was actioned and a return to departure airport was made. The cabin crew were requested to check and confirmed nr2 engine was feathered, with no evidence of oil or smoke apparent. The subsequent landing was uneventful and after AFS inspection, nothing untoward was found. The aircraft was taxied to stand for normal pax disembarkation. Engineering investigation found nr2 EEC at fault and it was replaced. The event has been assessed as a random failure of EEC. ☐ CAA Closure: The hazard is adequately controlled by the actions stated above.
200508998	15/10/2005	Take-off	Exeter		EGTT : London (FIR)	BAE	Turbofan	4	Take off rejected due to high engine vibration.	During the take off run an 'ENG VIB' caution was triggered, with the nr4 engine indicating '3' on the vibration gauge. The take off was rejected and as the aircraft slowed down it was noted that the nr3 engine was also indicating '3' on the vibration scale. The aircraft returned to stand. Fault traced to moisture at nr3 and nr4 transducer plugs, possibly associated with compressor wash conducted during the previous night.
200509130	05/11/2005	Approach	Manchester Barton A/F		EGTT : London (FIR)	PIPER	Reciprocating	1	MAYDAY declared due to engine failure while in the circuit. Forced landing approximately ½ mile from aerodrome. Full emergency declared. No injuries and no damage to aircraft.	
200509320	14/11/2005	En route	Isle Of Man (IOM)		EGTT : London (FIR)	DE HAVILLAND	Turboprop	2	Nr1 engine in-flight shut down due to propeller overspeed warning. MAYDAY declared. Aircraft landed safely with AFS in attendance.	Inquiries revealed that the aircraft systems worked as per design. NP probe failed in flight, which caused the prop to operate at the overspeed governor setting. FM then instructs a precautionary engine shutdown. Probe replaced with no reliability issues. See also 200706239, 200706742. ☐ CAA Closure: No further CAA action practicable.
200509324	10/11/2005	Take-off	Durham Tees Valley (TD)		EGTT : London (FIR)	DASSAULT	Turbofan	2	Nr1 engine failure/shutdown immediately prior to commencing take off run. Investigation identified that the fuel pump had excessively worn drive splines, which ultimately caused the run down.	After setting 1.55 EPR for take off and prior to brake release, a loud "whoosh" was heard from the LH engine. Simultaneously, the associated EPR, N1 and EGT all reduced. The engine was shut down and the aircraft returned to the ramp. Investigation identified that the fuel pump had excessively worn drive splines which resulted in disengagement of the pump from its drive and the subsequent loss of the gas generator air management, with subsequent run down. Further investigation identified this is the first failure of its kind within the fleet and does not in itself indicate a need to reduce the periodicity of scheduled inspection of the fuel pump drive splines, currently scheduled at overhaul of 5000hrs. ☐ CAA Closure: The hazard is acceptable provided the frequency remains low.
200509507	16/11/2005	En route			EGTT : London (FIR)	AIRBUS	Turbofan	4	Engine vibration leading to low oil pressure and shutdown.	At top of descent, on reducing power, vibration was felt coming from the nr2 engine. Subsequently, ECAM cautions were displayed in respect of a clogged oil filter and low oil pressure. Engine shutdown on approach and uneventful landing carried out. Nr2 engine to be replaced.
200509627	12/11/2005	Take-off	Denham		EGTT : London (FIR)	OTHER	Reciprocating	1	Engine failure at approximately 50ft altitude following take off. Forced landing on golf course. No injuries resulted.	Since the incident took place the aircraft has been exported to the Hungarian register. ☐ CAA Closure: No further CAA action practicable.
200510017	06/12/2005	En route	Stansted		EGTT : London (FIR)	BAE	Turbofan	4	Nr1 engine failed to respond to thrust lever movement during post maintenance test flight. Precautionary engine shutdown. PAN declared. N2 probe replaced.	During post maintenance test flight following replacement of nr2 and 4 engines (nr1 and 3 had been removed and refitted to the aircraft) and in the climb passing FL130, it was noted that nr1 engine TGT and N1 were lower than the other engines (TGT synch 800deg) with no advance light on the Thrust Management System (TMS) Control Display Unit (CDU). N2 indication then started to decrease and became erratic. Flight test was cancelled and aircraft returned with the engine appearing to operate normally at reduced thrust settings. Tech Log entry made and engineering investigation suggested that the nr1 engine oil filler cap seal required replacing. Flight test was recommenced and, whilst climbing through FL100, the first indication error occurred on the N2 gauge, which again appeared to be a mechanical type clicking action with N2 valves fluctuating between 80 and 40%, shortly followed by N1 and TGT fluctuations. It then became apparent that the engine was not responding to the thrust lever (noted that at no time did the handling characteristics indicate anything other than normal engine operation) and a precautionary engine shutdown was carried out. PAN declared and aircraft returned. Following this event, fluctuations in N2 were observed on subsequent flights, despite replacement of the nr1 engine FCU and the bleed band actuator. The fault was eventually rectified by replacement of the nr1 engine N2 probe that had been giving a false signal to the TMS. Flight check carried out satisfactory. The aircraft was returned to service with no further reports relating to the originating defect. The failure of the engine to respond appropriately to the thrust lever movement was attributed to the TMS following the false N2 signal. This affected the input to the TMS computer and to the nr1 engine's TMS actuator, hence the unstable engine. Reports of N2 failure affecting engine operation are not common on the ALF502/146 engine and lack of effective fault diagnosis and crew de-brief may have contributed to the continuation of the reported defect that could not initially be replicated on the ground. ☐ CAA Closure: The hazard is adequately controlled by the actions stated above.
200510080	05/12/2005	En route	Plymouth Sound		EGTT : London (FIR)	WESTLAND	Turboshaft	2	PAN declared due to engine problems. Engine shutdown. Diverted to Plymouth.	

200510160	12/12/2005	En route	Exeter		EGTT : London (FIR)	DE HAVILLAND	Turboprop	2	Nr2 engine low oil pressure. Engine shut down. MAYDAY declared. Aircraft diverted.	On an earlier sector departing Belfast, ATC reported excessive smoke from nr2 engine following take-off, although all indications were normal and the sector was completed without incident. When climbing through FL90 on the subject flight, the SCCM reported a strong smell of fuel in the cabin. Checks indicated fuel flows and contents were matched. The Captain then noticed nr2 engine pressure briefly dropped to zero before returning the 30psi. Engine oil pressure drill carried out and the engine was shut down. MAYDAY declared and the aircraft diverted to Exeter. Emergency services deployed for landing and the aircraft was shut downon a taxiway. Following engineering investigations, oil pressure transmitter, p/n APT1000-100-DW, fitted to nr2 engine was replaced. The low oil pressure, as indicated from a review of pressure gauge, had no reported activation of the low oil pressure light. Engine oil system inspected with no faults found. With regards to the report of a fuel smell in the cabin, during initial function tests of the air conditioning system an oil odour was reported but after further functions no further smells were reported. □ CAA Closure: No further CAA action practicable.
200510709	31/12/2005	En route	GURLU		EGTT : London (FIR)	OTHER	Unknown		Engine shutdown due to oil problem. PAN declared. Aircraft instructed to squawk 7700. Direct routing given.	
200600005	03/01/2006	Take-off	London-Heathrow - LHR		EGTT : London (FIR)	AIRBUS	Turbofan	2	Nr1 engine high EGT. Aircraft returned. Cause traced to open circuit solenoid valve. Valve and EEC replaced.	Slight vibration noted after take off, with nr1 engine EGT entering the 'amber' segment. Thrust lever retarded to idle, but EGT remained high although in the 'green' segment. Return to departure airport initiated. During final stages of approach, EGT became 'amber' again and the engine was shut down. Single engine landing carried out without incident. Following inspection by fire crew, aircraft taxied to stand. Investigation revealed heat damage to the inboard engine cowl, in the area of the 10th stage bleed valve. This valve only opens on engine start and damage was suspected to be as a result of the valve being open and causingdisruption of the schedule air flow through the core. Troubleshooting was carried out and the 10th stage solenoid valve was found to be open circuit. This component was replaced and the EEC was replaced as a precaution. Borescope inspection and an engine ground run was carried out satisfactorily. The engine has operated satisfactorily since. There are no reliability issues with this unit. This is considered a rare occurrence and no further action will be taken at this time. The operator has employed active monitoring of the fleet.□ CAA Closure: The hazard is adequately controlled by the actions stated above.
200600303	16/01/2006	En route			EGTT : London (FIR)	BAE	Turbofan	4	Vibration warnings received on three engines during flight in icing conditions. PAN declared and precautionary descent carried out. Fan blade icing was the most probable cause.	The aircraft was in the cruise at FL220 in heavy icing and dense cloud but no precipitation. Engine and airframe anti-icing and de-icing was selected ON. A nr2 engine vibration warning was received (1.4 units), followed in quick succession by a nr3 engine vibration warning (also 1.4 units) then a nr1 engine vibration warning (1.3 units). A PAN was declared together with a request to descend to FL100 toclear icing conditions. Following the descent the enginesstabilised and returned to normal parameters. The flight continue to destination and a normal landing was effected.Investigation iaw seasonal additional maintenance requirements, including inspection of engine intakes, fan blades,compressor inlets, pylons and wing leading edges, and high power engine runs could not reproduce the fault. Fan blade icing was the most probable cause. SIL 12/025 "Engine fan blade cleaning" exists to assist operators in minimising the onset of ice formation during winter operations. A review of this SL led to revised additional maintenance requirements being issued to enable accomplishment of engine fan blade cleaning. An additional task has been added to Aircraft MP Calendar times to initiate fan blade cleaning before the subsequent onset of the winter operation. See also 200306992.□ CAA Closure: The hazard is adequately controlled by the actions stated above.
200600325	16/01/2006	Take-off	London-Gatwick - LGW		EGTT : London (FIR)	AIRBUS	Turbofan	2	ECAM 'ENG 1 STALL' warning activated during initial climbfollowing wake turbulence encounter from preceding B777.	On passing 6500ft, turbulence was encountered from the preceding B777 -10nm ahead plus 2500ft above. ECAM 'ENG 1 STALL' warning activated. ECAM actions carried out. All engine parameters were normal. ATC informed and a heading change requested. On advising the cabin crew of the situation they confirmed a 'banging' noise had been heard from the nr1 engine. Engineering consulted on box two. Decision madeto continue. See also 200712508.
200600601	25/01/2006	En route	Wembury		EGTT : London (FIR)	DASSAULT	Turbofan	2	RH engine oil pressure warning. Engine shutdown, fuel burnt off to below max landing weight and uneventful single engine recovery carried out. Transmitter failed.	The red oil pressure light illuminated although the oil pressure and temperature gauges indicated normal. Low pressure switch/transmitter (p/n 1-1346AA s/n 676) replaced.
200600713	29/01/2006	En route	Midhurst (MID)		EGTT : London (FIR)	MCDONNELL DOUGLAS	Turbofan	3	Nr3 engine shutdown due to low oil pressure. Aircraft descended to FL250. PAN declared. Fuel dumped over sea and aircraft returned. Aircraft instructed to squawk 7700.	
200600758	01/02/2006	En route	WELIN		EGTT : London (FIR)	BAE	Turbofan	4	Nr2 engine in-flight shut down due to low oil quantity. PAN declared.	During cruise it was noted that nr2 engine oil quantity indicated low, then 5 minutes later it indicated empty withfluctuation of the oil pressure indication. As a precaution the nr2 engine was shut down and the QRH drill actioned. It was noted that the AC pump failed to run in auto - pump selected to on and yellow pressure regained. A decisionwas made to continue to destination and a PAN was declared. Pump assembly p/n 2-193-790-0 replaced due to failure of scavenge pump rotor.
200600934	04/02/2006	En route			EGTT : London (FIR)	EUROCOPTER	Turboshaft	2	Nr1 engine chip warning. 'Chip pulse' activated and warning extinguished but recurred intermittently 10 minutes later. Aircraft returned. Checklist actioned. Landed safely with AFS in attendance.	Warning continuous during final approach. Mag plug removed, small silver found. Oil system drained/replenished and ground run carried out satisfactory. Particle and oil sample sent for analysis. Fault recurred later that same day during which a PAN was declared. Minimal chip particle found. Ground run carried out and aircraft returned to service. Awaiting results of oil analysis.
200601059	09/02/2006	En route	MAMUL		EGTT : London (FIR)	OTHER	Unknown		Emergency declared due to engine problem/shutdown. Aircraft instructed to squawk 7700 and descended to FL200. Diverted to Mildenhall.	
200601104	14/02/2006	En route	London-Heathrow - LHR		EGTT : London (FIR)	BOEING	Turbofan	4	PAN declared with one engine shutdown due to oil pressurewarning.	
200601176	15/02/2006	Approach	Cardiff (CDF)		EGTT : London (FIR)	ATR	Turboprop	2	Nr2 engine torque and Np fluctuations. Engine shutdown. PAN declared. Aircraft landed safely.	See also 200601175 same aircraft, previous day.
200601630	28/02/2006	En route	Ramsgill		EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	2	Nr1 engine shutdown due to significant oil loss. Oil tankvent outlet hose detached. Maintenance error.	In the cruise it was noted that nr1 engine oil pressure had begun to fluctuate. This was followed by engine torque fluctuations and a drop in engine oil temperature. During engine shutdown, the associated chip light illuminated. After landing, it was discovered that the nr1 engine oil tank vent outlet hose had detached at the reduced portion of the hose attachment port to the tank. A significant quantity of the tank's contents had vented onto the main rotor gearbox platform. Inspection of the chip detector revealed the presence of significant particles, which were retainedfor analysis. Engine and oil tank changed. Investigation conducted by the maintenance organisation involved who suspect that the damage was caused by a temporary member of staff conducting an engine component repair on 6 Feb 2006, who inadvertently caused the damage to the component by introducing a maintenance related stress fracture into the oil tank and its outlet port fitting. The management of themaintenance organisation involved state that the employment of temporary staff is now subject to an increased levelof control and supervision.□ CAA Closure: The hazard is adequately controlled by the actions stated above.
200601638	27/02/2006	En route			EGTT : London (FIR)	BOEING	Turbofan	2	RH engine shutdown due to oil warning. Aircraft returned to East Midlands Airport. Full emergency initiated by ATC.	
200601690	04/03/2006	Approach	Halton (Buckinghamshire)		EGTT : London (FIR)	SCHEIBE	Reciprocating	1	Propeller separated in flight. A/c landed safely without further damage or injury to 1 POB. AAIB AARF investigation.	AAIB Bulletin 7/2006, ref: EW/G2006/03/02 - Summary: Whilst at 1,000ft on the downwind leg of the circuit for Runway 02, the pilot experienced rapidly increasing airframe vibration: approximately five seconds later the engine stopped suddenly. The pilot noticed that the propeller was no longer attached to the engine and landed successfully on analternate runway. Investigation revealed that the loss ofthe propeller was due to the fatigue failure of the boltssecuring the propeller back-plate to the crankshaft. As result of this accident the engine manufacturer has incorporated a number of changes to the 'M' propeller installation for this engine type.□ CAA Closure: The hazard is adequately controlled by the actions stated above.

200601889	16/02/2006	En route	Exeter	7nm SW	EGTT : London (FIR)	MBB	Turboshaft	2	PAN declared and one engine shut down due to a "particle chip indication".	Aircraft landed safely at Exeter with emergency services in attendance.
200602123	19/03/2006	Approach	North Togston (Northumberland)		EGTT : London (FIR)	RANS	Reciprocating	1	UK Reportable Accident: NLG collapsed during forced landing in field following engine failure. Substantial damage. No injury to 2 POB. AAIB AARF investigation.	AAIB Bulletin 06/2006, ref: EW/G2006/03/14 - Summary: Approximately 45 minutes into the flight whilst in the cruise, the engine began to run roughly and stopped. The pilot carried out a forced landing during which the nose landing gear failed and the aircraft pitched forward, causing damage to the propeller and nose cowlng. The weather had beenvery wet in the few days prior to the accident leaving the ground in a waterlogged condition which may have contributed to the damage sustained during the forced landing. The pilot exited the aircraft without injury. The engine wasexamined after the accident by the pilot's usual maintenance organisation and was found to have seized. It was equipped with an integrated oil pump which delivers the exact amount of oil required for engine lubrication. The engine oil tank was found to be empty. The pilot stated that he checked the oil tank prior to flight and he noted that someoil was present.□ CAA Closure: No CAA action appropriate.
200602313	15/03/2006	Approach	Wyton		EGTT : London (FIR)	AEROSPATIALE	Turboshaft	2	LH engine chip light illuminated. Chip plug contaminated by debris.	LH engine chip light illuminated on approach. Chip pulse pressed but light remained on and with all engine indications normal, an uneventful landing was carried out. Subsequent inspection of chip plug iaw RR 250-C20 OHM revealed contamination by minor debris. Debris assessed as new build debris - new turbine fitted 10 airframe hours previously. Debris removed and engine ground run satisfactorily completed. Total airframe hours/landings 6146.05/17358.
200602320	23/03/2006	En route	Exeter		EGTT : London (FIR)	BEECH	Reciprocating	2	PAN declared following failure of one engine to restart after being shut down for training purposes. A/c returned and landed safely.	
200602558	30/03/2006	En route	Scillies (English Channel)	Eastern Isles	EGTT : London (FIR)	SIKORSKY	Turboshaft	2	Nr2 engine shut down due to chip warning. PAN declared. Diversion to St. Mary's. Nr5 mag plug contaminated with debris.	At 500ft and 110kts IAS during cruise the nr2 engine chipwarning illuminated. The circuit breaker was recycled butthe warning remained on therefore the nr2 engine was shutdown iaw the emergency checklist. A PAN was declared and an uneventful single engine approach and landing carried out at St. Mary's. Continuity check of nr5 mag plug chip detector carried out and plug then removed for inspection and accumulation of particles assessed within limits of GE maintenance manual. Subsequent engine ground run carried out with nil defects apparent and aircraft returned to service. On return to base and as a precaution, nr2 engine mainoil pressure filter was also inspected iaw the maintenance manual with nil debris present. The reporter comments that the defect was not entered in the Tech Log until the aircraft returned to base and that a Certificate of Release to Service (CRS) was not issued prior to return flight. Asa consequence, crews will be re-briefed on the importanceof ensuring that the Tech Log is properly completed priorto accepting aircraft for further flights.
200602590	01/04/2006	En route	Detling (DET)		EGTT : London (FIR)	BAE	Turboprop	2	PAN declared during climb due to engine shutdown following low fuel pressure warning and low torque indication. Aircraft returned. Fuel pump failure.	Low fuel pressure warning light illuminated and low torque indication activated during the initial climb. Precautionary engine shutdown. PAN declared and squawk 7700 allocated. The aircraft returned, where it landed uneventfully. Investigation identified a fuel pump failure. Pump replacedand, following analysis of the engine history, the gearbox was also changed. No other incidents reported across thefleet.□ CAA Closure: The hazard is acceptable provided the frequency remains low.
200602805	08/04/2006	En route	WELIN		EGTT : London (FIR)	HAWKER SIDDELEY	Turbofan	2	Nr2 engine FADEC fault warning/engine failure in cruise. PAN declared. Checklist actioned. FADEC malfunction.	Engine troubleshooting carried out iaw MM CH 72-00-00, fault isolation section. Ground runs carried out with no further faults. The FADEC system has no manual reversion, forththe engine to rundown due to a FADEC fault, both channelshave to be faulty. Both the nr1 (p/n 1203KDC09-006) and nr2 (p/n 1203KDC09-007) FADEC computers were replaced with p/n 1203KDC09-008 as a precaution. The subsequent strip report of the suspect faulty FADEC computer is still ongoing, however, preliminary results from testing carried out todate indicate that there is a defect present that intermittently causes a lane change failure. The failure mode results in one control lane failing and attempting to relinquish control to the other channel but the other channel is unable to obtain control. The result would be an EEC failure and an engine shutdown. This information has been passed to EASA for their attention.□ CAA Closure: No further CAA action required at this time.
200603422	27/04/2006	Approach	Manchester (MCT)		EGTT : London (FIR)	PIPER	Reciprocating	2	PAN declared due to smoke from RH engine. Engine shut down. Oil leak suspected.	Priority approach and landing with emergency services in attendance.
200603492	01/05/2006	En route	Lambourne (LAM)		EGTT : London (FIR)	AIRBUS	Turbofan	2	PAN declared due to engine nr1 overtemp. ECAM showed 765°C and 720°C at idle. Engine shut down and aircraft landed safely.	Centralised fault display system (CFDS) download indicated maximum EGT 810.3" and maximum N2 100.5%. Investigation by engineers found the variable stator vane (VSV) control rod had become disconnected from the VSV actuator. The nutand D headed bolt were found on top of the bifurcation panel next to pipes/loom. The running torque of the stiff nut to bolt is 40 lbs in. The position of the variable stator vanes was approximately a bolt hole out from the idle position. Engine subsequently replaced.
200603970	13/05/2006	En route	Biggin (BIG)		EGTT : London (FIR)	HUGHES	Reciprocating	1	Engine failure. Investigation found that the exhaust valve had been broken by impact with the piston and had then been ejected downstream.	While in straight and level flight, a "clonk / bang" was heard and felt, the aircraft shuddered and became unstable. As the aircraft was established in autorotation, it was noted the rotor rpm was in the 'green' but the engine had stopped. A successful landing followed with no occupant injury or damage to the aircraft. Investigation, including thorough inspection, found that the exhaust valve appeared to be missing and was recovered in two pieces inside the exhaust silencer box. It had been broken by impact with thepiston and then had passed out of the exhaust port. Half of the valve collet was found in the cylinder head and theother half was found in the bottom of the engine. The engine was sent for a strip report, which was inconclusive but noted that the valve springs showed signs of coil binding.□ CAA Closure: No further CAA action practicable.
200604036	18/05/2006	En route	Thames Estuary (Greater London)		EGTT : London (FIR)	BOEING	Turbofan	4	PAN declared due to apparent nr1 engine exhaust fire. Engine shutdown. A/c landed safely. No damage or injuries reported. AAIB Field investigation.	AAIB Bulletin 12/2006, ref: EW/C2006/05/01 - Summary: A passenger saw what appeared to be small flames coming from between the nr1 engine exhaust shroud and its pylon; the flight crew were informed. The engine indications were normal; nevertheless, the commander decided to shut the enginedown. The 'flames' continued until the aircraft was slowed for an approach. The aircraft landed uneventfully. Investigation revealed that a rubber seal had torn, and that when agitated by the air flow it gave the appearance of flames. There had been eleven previous events reported on similar aircraft. The aircraft manufacturer has identified an alternative seal and recommended that operators inspect the affected area on a periodic basis and replace damaged seals.□ CAA Closure: The hazard is adequately controlled by the actions stated above.
200604334	22/05/2006	Approach	Coventry		EGTT : London (FIR)	OTHER	Other		Helicopter diverted to Coventry due to gearbox chip detector warning. PAN subsequently declared with engine failure. Helicopter landed safely.	
200604342	26/05/2006	En route	Compton (CPT)	5nm W	EGTT : London (FIR)	CESSNA	Turbofan	2	Emergency declared due to double engine FADEC indication.A/c returned and landed safely. P2 probes possibly iced up.	Climbing through FL220 both amber engine control system lights illuminated. Checklist actioned but attempt to resetFADECs was unsuccessful, as was changing FADEC channels and selecting LH engine anti-icing, the crew having previously elected not to use engine anti-icing in view of the clear air and relatively warm ram air temperature (RAT) of +4deg C. Emergency declared and a/c returned to Hurn. FADECdownload subsequently passed to a/c manufacturer, who concluded that the fault indication was most likely due to one or both engine PT2 probes icing over, which can occur attemperatures +10deg C or colder. In order to clear the fault the aircraft manufacturer advises that the engine anti-icing should be switched 'on' and, after waiting for approx 5 minutes, the FADECs should be reset: this is the onlyin-flight FADEC reset possibility. Also, it is important to make sure the engine anti-ice has been selected 'off' for a period of two minutes before shutting the engines down as this can cause the sensed temperature to exceed the FADEC limits. Reset carried out iaw manufacturer's advice and a/c returned to service.
200604623	10/05/2006	Approach	Gloucester-Staverton		EGTT : London (FIR)	CESSNA	Reciprocating	1	Diesel engine failure due to transient fuel starvation.	The aircraft departed with 135.1 litres of fuel (Jet A1) of which 120 litres was usable, for a planned flight of 7hours total airborne endurance. With approximately 1 hourof endurance remaining and prior to approach, the low fuel lights started occasionally flickering during a roll, which was expected when the fuel level was less than ¼ tank,the pilot estimating approximately 20 - 25 litres of fuelremaining. With the aircraft rather too high on approach,a 'crab technique' using sideslip was employed to reduce altitude. At 100ft altitude, a small amount of power was applied but the engine "coughed". Full power was applied, the pump was checked as 'on' and the other fuel tank (LH) selected but the engine still failed to restart. The aircraft landed safely and towed to the ramp. FADEC lights 'A' and 'B' were flashing but the engine would not restart on either FADEC. Both fuel tanks were dipped, confirming 22.7litres of useable fuel remaining which equated to a remaining endurance of approximately one hour. A computer download from the FADEC confirmed the engine had stopped due tofuel starvation. Fuel filters were checked but no contamination was found to impede fuel flow. The fuel system was bled and the engine operated normally. It was believed the failure was due to fuel starvation caused by the fuel tank outlets of the selected tank being momentarily uncovered, resulting in an airlock and permanent stoppage of the engine. The reporter alleges, 1) shortcomings in the Pilot's Operating Handbook (POH) highlighting this eventuality as 'caution' and not warning; 2) POH also fails to mention that temporary fuel starvation due to a transient uncovering of the fuel outlets will result in the permanent stoppage of the engine; 3) and suggests that a different fuel selector be standardised allowing a choice of 'Left, Right and Both' tanks to be selected. The reporter has subsequently resolved that "in future, subtract an extra one hour from the endurance figures when planning a flight and refuelthe aircraft by five hours of operation from full tanks or when it is calculated 30 litres of fuel is remaining in total - which ever is the soonest". EASA are responsible for the continued airworthiness of this aircraft and they have been informed of the reported occurrence. CAA have raised a number of issues relating to this occurrence and EASA are addressing any necessary corrective actions required. See also 200707132 - same aircraft.□ CAA Closure: No further CAA action practicable.

200604804	08/06/2006	En route	Unknown		EGTT : London (FIR)	DORNIER	Turboprop	2	Nr2 engine shut down due to vibration and RPM fluctuation. PAN declared. Defect traced to the tachogenerator, which was replaced.	At 3000ft during cruise, the aircraft yawed momentarily right and nr2 engine RPM was noted to be erratic, with associated vibration and audible engine fluctuation. Speed lever had little effect on the engine. Emergency checklist actioned, nr2 engine shut down and PAN declared. Uneventful landing carried out. Extensive investigation of the reported symptoms traced the only identifiable relevant defect to the tachogenerator. The component was replaced and the engine tested thoroughly without further indications of the other reported symptoms. The FCU, although serviceable, was replaced as a precautionary measure and to aid in further fault diagnosis. The rectified defect would only have resulted in an indication error and therefore the reported symptoms of compressor stall could not be confirmed. The aircraft was returned to service. No recurrence since.☐ CAA Closure: The hazard is adequately controlled by existing requirements, procedures and documentation.
200604843	09/06/2006	En route	Ockham (OCK)		EGTT : London (FIR)	AIRBUS	Turbofan	2	Nr1 engine shutdown due to low oil quantity/pressure warning. PAN declared. Maintenance error.	While approaching Ockham VOR to enter hold, a 'LOW OIL QTY' advisory message was received followed by 'LOW PR'. Nr1 engine thrust set to idle followed by ECAM warning 'ENG 1 LOW OIL PR' and nr1 shutdown. PAN declared, ECAM completed and CAT 3 single engine landing carried out uneventfully (APU already started as a precaution during initial advisory). Investigation established that the incident occurred while the aircraft was positioning following some heavy maintenance with a third party maintenance organisation. The engine (s/n V10662 TSN 12432 CSN 12275) was subsequently removed and routed to the operator's workshops where it was discovered that a loose bolt and locking washer, found in the bottom of the nr5 bearing chamber, partially blocked the scavenge drain. It is considered that, when the engine was throttled back at TOD, the subsequent drop in suction from the scavenge pump and the restriction of the drain, caused the bearing chamber to overfill and vent the excess oil into the exhaust. This bearing chamber had been opened up on the heavy maintenance check immediately prior to this incident to carry out EO A320/V25/72-0461/5, which required removal of the bearing oil jet in order to clean the compartment. The loose bolt was left in the bearing chamber by a technician at the third party maintenance organisation. Their subsequent investigation concluded that there had been non-compliance with company established procedures by the technicians, with several failings evident. The maintenance organisation has spoken to the technicians and other team members involved to make them aware of the discrepancies and remind them of their responsibilities. This was one of three incidents experienced by this operator following work carried out by this organisation. As a result, the operator will not be using this organisation in future.☐ CAA Closure: No further CAA action practicable.
200604973	01/06/2006	En route			EGTT : London (FIR)	PIPER	Reciprocating	2	Nr2 engine shutdown due to oil quantity/pressure loss. Aircraft returned. Investigation established pre-ignition had occurred at the nr5 cylinder. Engine rebuilt.	Nr2 engine low oil pressure indication. Visual inspection of engine showed a large amount of oil on engine cowlings. Return initiated during which oil pressure reduced further. Engine shutdown and uneventful landing carried out. Investigation, including overhaul, confirmed pre-ignition had occurred at the nr5 cylinder. Nil further defects evident on strip investigation. Engine rebuilt in accordance with overhaul manual.☐ CAA Closure: The hazard is acceptable provided the frequency remains low.
200605373	22/06/2006	Approach	Penzance		EGTT : London (FIR)	SIKORSKY	Turboshaft	2	Intermittent nr1 engine fire warning during approach. Engine shutdown, MAYDAY declared and run-on landing carried out.	Fire service attended and confirmed there was no fire. See also 200309046.
200605659	02/07/2006	En route	Kidderminster		EGTT : London (FIR)	EUROCOPTER	Turboshaft	2	Nr2 engine chip caution illuminated in flight.	Whilst in level cruise Eng 2 Chip caution illuminated. Fuzz burner selected 'on' but caution failed to clear. Nr2 engine shut down in accordance with checklist and flight continued to destination. Following landing, the caution failed to illuminate when the battery master was selected on. Both master chip detectors removed, inspected and samples taken, oil filter removed and examined with no particles present. Spectrographic Oil Analysis (SOA) sample taken. Oil change carried out. Ground run completed and aircraft returned to service.
200605764	02/07/2006	Approach	Gloucester-Staverton		EGTT : London (FIR)	EUROCOPTER	Turboshaft	2	During an emergency, two way communications could not be established between ATC and fire vehicle, so details were passed by telephone to a fireman who ran to the fire station and transmitted blind.	Subsequent analysis of UHF frequency recordings ascertained that the ATSA had not actually transmitted the message on the frequency, although they could be heard passing the details through an open phone line. The fire crew were then transmitting almost continuously with an increased sense of urgency and these transmissions crossed with incoming messages from the ADC position and the hand held radio, giving the impression that the system was unserviceable, when it was actually inappropriate RT technique that caused the failure of two way communications. The ATSA could not explain why his initial transmission had not been broadcast. A touch screen VCCS was installed two months previously and all staff had received the appropriate training. It is possible that either the transmit function had inadvertently been deselected or the PTT had not been fully pressed. The fire vehicle is equipped with a mobile phone, however, this appears to have been overlooked as a possible means of emergency communications in the event of the apparent UHF failure. Closer investigation then revealed that the phone had been blocked by the service provider due to lack of use. A replacement SIM card has been installed in the phone and the emergency orders and telephone list are to be updated. It was also established that the fire crew had undertaken RT training 3 years previously and were, therefore, due for refresher training. Additionally, a reminder will be issued to ATC staff to ensure that the correct selection and transmitting techniques are used on the new system. This will include a requirement to conduct a radio check whenever handover of watch occurs in the ATSA position.☐ CAA Closure: The hazard is adequately controlled by the actions stated above.
200605873	07/07/2006	En route			EGTT : London (FIR)	DE HAVILLAND	Turboprop	2	Nr1 engine shutdown and PAN declared due to low oil pressure warning. A/c landed safely with AFS in attendance. Evidence of oil leak on nr1 engine cowling. Maintenance error.	Investigation determined that engine run parameters post oil filter change were not accomplished, therefore, the oil leak (caused by an incorrectly seated seal) was not detected. Appropriate action taken and engineer involved has received additional training.☐ CAA Closure: The hazard is adequately controlled by the actions stated above.
200605953	05/07/2006	Manoeuvring	Valley	10nm NW	EGTT : London (FIR)	BELL	Turboshaft	2	Engine failure. PAN declared. Bearing in nr2 accessory gearbox failed.	During a deck winch training sortie, the aircraft was clearing back from the deck at 10 units when the airframe wobbled and the aircraft immediately descended from 40ft ASL. The Captain took control and with decaying Nr, a torque split, low Nr audio warning and Rad Alt Low height warning, initiated a fly away. The Nr was observed at 91% and the aircraft bottomed out at 20ft ASL before climbing away. Nr1 engine temperature was noted to be in the red band. PAN call made to the ship and, once in a safe flying condition, nr2 engine failure was diagnosed. PAN then declared to RAF Valley where a zero speed landing followed. Investigation concluded failure within nr2 engine accessory gearbox. Engine replaced. As nr1 engine required a post over temperature inspection by the engine manufacturers, that engine was also replaced. Strip inspection attributed failure to bearing in nr2 accessory gearbox. No further action to be taken due to low frequency of events.☐ CAA Closure: No further CAA action required at this time.
200606330	18/07/2006	En route	Pontypridd (Glamorgan)	Treforest Industrial Estate	EGTT : London (FIR)	DENNEY	Reciprocating	1	Aircraft crashed on an industrial estate road after losing engine power. Substantial damage. Minor injuries to two POB. AAIB AARF investigation.	AAIB Bulletin 3/2007, ref: EW/G2006/07/28 - Summary: The aircraft suffered a substantial loss of engine power and crashed into an industrial estate following an attempted forced landing into school playing fields.☐ CAA Closure: No CAA action appropriate.
200606615	20/07/2006	En route	Luton (LUT)		EGTT : London (FIR)	EUROCOPTER	Turboshaft	2	Stepper motor failure.	During a climb with nr1 engine set to training, 'Nr2 Engine Degrade' caution illuminated. Training mode automatically cancelled. The engine status page showed stepper motor failure on nr2 engine. On shutdown, nr2 first limit indicator FLI failed and the systems status page showed DN1 and TQ Ind failure. Following a FADEC dump, nr2 HMU (p/n: 0319858020) found to be defective (stepper motor failure). Unit replaced and the aircraft was released to service. See also 200509190, 200602583 and 200603579.
200606641	21/07/2006	Approach	Southend (SND)		EGTT : London (FIR)	AGUSTA	Turboshaft	2	PAN declared with one engine shutdown. A/c diverted to Southend and landed safely.	
200606812	31/07/2006	En route	Biggin (BIG)		EGTT : London (FIR)	BOEING	Turbofan	2	AAIB Initial Notification: MAYDAY declared after shutting down nr1 engine, which was stuck at cruise power. Priority routing given and aircraft landed safely.	
200606892	02/08/2006	En route			EGTT : London (FIR)	BOEING	Turbofan	2	MAYDAY declared due to engine loss.	Failure of engine found to be due to leaking FFG. Unit replaced, aircraft returned to service. See also 200606901. CAA Closure : No further CAA action required at this time.
200606916	01/08/2006	En route	En Route		EGTT : London (FIR)	BEECH	Turboprop	2	LH engine in-flight shut down. A/c diverted. Fuel float check valve sticking and LH outboard wing fuel vent pipe incorrectly manufactured. Manufacturer's Communiqué issued.	During cruise, LH engine torque fluctuated between approx 1850lb/ft and 400lb/ft over several seconds, before falling to zero. LH auto ignition annunciator lit and reporter had the opinion that the a/c yawed in time with the fluctuations and that the engine was not producing power. After an instrument check revealed no obvious cause, the engine was shut down and the a/c diverted. Uneventful single engine landing carried out. Engineering investigation found the cause to be a combination of a sticking fuel float check valve and an incorrectly manufactured LH outboard wing fuel vent pipe that prevented adequate venting of the fuel tank during refuelling/fuel transfer. The pipe has a welded joint that should have been drilled during manufacture but was not. This prevented the vent system from working correctly. Float check valve and vent pipe replaced and no further problems reported. This precise defect was highlighted to operators in Raytheon Communiqué No 2004-02, item ATA 28 'B200/B300 Fuel Vent System Inspection' and is a known problem.☐ CAA Closure: The hazard is adequately controlled by the actions stated above.

200606981	05/08/2006	Approach	EGLD : Denham	Denham Green	EGTT : London (FIR)	CESSNA	Reciprocating	2	Both engines lost power on approach due to fuel starvation. A/c crashed into woodland and was destroyed. Serious injuries to all six POB. AAIB Field investigation.	AAIB Bulletin 10/2007, ref: EW/C2006/08/01 - Summary: Theaircraft was completing a day VFR flight from Durham TeesValley Airport to Denham Airfield. As the pilot turned onto the final approach for Runway 06, the right engine random. The pilot attempted to increase power on the left engine but it did not appear to respond. The airspeed decayed and the right wing dropped. The aircraft descended intoa wooded area short of the runway, seriously injuring allthose on board. The investigation identified that fuel starvation of both engines was the cause of the accident. One Safety Recommendation (2007-086) is made to the FAA.☐ CAA Closure: The Recommendation made in respect of this occurrence is not addressed to the CAA and is to be actioned directly by the relevant body. No further CAA action is practicable.
200607052	06/08/2006	En route	Leicester (Leicestershire)		EGTT : London (FIR)	AERONCA	Reciprocating	1	UK Reportable Accident: Engine failure on take-off. Forced landing in field off end of runway. Landing gear collapsed. No injuries to one POB. AAIB AARF investigation.	AAIB Bulletin 3/2007, ref: EW/G2006/08/06 - Summary: After take off, at approximately 100ft aal, the aircraft's engine lost some power. The pilot retarded the throttle slightly before opening it fully. Full power was regained and the climb was continued. At approximately 300ft aal the engine lost all power and stopped. The pilot flew a forced landing into a field of wheat. During the landing roll the aircraft's main landing gear collapsed. The temperature was27deg C and the dew point was 14deg C. Testing of the aircraft's engine and fuel system after the accident revealedno pre-existing damage and no mechanical reason as to whythe engine failed. The aircraft's magnetos were subsequently sent to an independent maintenance organisation for testing. Under test one magneto stopped when it reached operating temperature due to leaking insulation. The other showed signs of failure before stopping. These results imply that the most probable cause of the engine failure was a double magneto failure. Given the high ambient temperature it is likely that the magnetos achieved a high operating temperature soon after take off prior to the failure of thefirst and subsequently the second magneto.☐ CAA Closure: The hazard is acceptable provided the frequency of occurrence remains low.
200607113	08/08/2006	En route	Bristol International		EGTT : London (FIR)	PIPER	Reciprocating	2	PAN declared with RH engine shutdown due to rough running. A/c landed safely.	
200607298	09/08/2006	En route	Pangbourne (Berkshire)	Nr Reading	EGTT : London (FIR)	EUROCOPTER	Turboshaft	2	LH engine chip warning. Engine shut down. Aircraft returned.	During cruise at 80kts LH engine chip master caution illuminated and appropriate actions were carried out iaw Flight Reference Cards (FRCs). Fuzz burn did not clear the chipwarning, therefore the engine was set to ground idle and then shut down. Aircraft returned to base - during approach transmission on ATC 2 via the cyclic control was lost, therefore the auxiliary transmit button on the console was used. LH engine mag plugs inspected and debris found on forward/lower plug - debris assessed as minor. SOAP sample taken, oil system flushed/replenished and oil filter element replaced. Engine ground run satisfactorily carried out with no defects evident and aircraft released to service. Engine s/n 32227, total engine hours 1043, total engine hours since inspection 64. Manufacturer advised. Fault recurred 2 days later - 200607211 refers.
200607476	18/08/2006	Approach	Scampton		EGTT : London (FIR)	BEECH	Turboprop	2	RH engine torque fluctuated and failed to respond to power lever movement. ORH actioned/engine shutdown. PAN declared. Asymmetric circuit flown and landed safely.	Following extensive engineering investigation in collaboration with the aircraft and engine manufacturers, no faultfound. Aircraft returned to service and no recurrence following 21 flights, 28 flying hours, 15 engine cycles and 104 landings.
200607517	22/08/2006	En route	Southampton (SAM)		EGTT : London (FIR)	BRITTEN NORMAN	Reciprocating	3	Rear engine failure. Nr2 cylinder head failure. Followingreview, cylinder inspections reduced to 75hrs and use of standard cast cylinders discontinued.	Climbing through 3000ft a loud bang was heard followed a few seconds later by severe vibration. All engine indications remained normal but thick black smoke was observed coming from the rear engine, which was shutdown. The a/c returned and landed safely with the fire service in attendance. There was no evidence of fire but the whole tail sectionwas covered in oil. Engineering investigation traced fault to nr2 cylinder head failure. A thorough review into cylinder cracking was conducted going back to 2001. The outcome of this review reduced cylinder inspections to 75hrs and discontinued the use of standard cast cylinders. See also 200605539.☐ CAA Closure: The hazard is adequately controlled by the actions stated above.
200607723	26/08/2006	En route	Edingale (Staffordshire)		EGTT : London (FIR)	ARV	Reciprocating	1	UK Reportable Accident: Coolant drive belt failure leading to engine overheat. Forced landing in a field. NLG collapsed and a/c overturned. Minor injury to one POB. AAIB AARF investigation.	AAIB Bulletin 11/2006, ref: EW/G2006/08/25 - Summary: Theengine water pump drive belt broke causing the engine to overheat. The pilot shut the engine down and during the subsequent forced landing the aircraft landed heavily on thenose wheel, which collapsed causing the aircraft to turn over onto its back.☐ CAA Closure: No CAA action appropriate.
200607841	01/09/2006	En route	GASKO		EGTT : London (FIR)	SAAB	Turboprop	2	LH engine shut down due to high oil temperature. PAN declared and aircraft diverted to Humberside. Fault attributedto a faulty transducer, which was replaced.	Engineering investigation, including oil level checks andground runs could not reproduce the fault. The engine manufacturer was consulted. Their record of previous similar defects had indicated the problem was most likely attributed to the oil tank 'oil level/temperature sensor' and recommended that it be replaced. This was carried out and there has been no recurrence to date.☐ CAA Closure: The hazardsis adequately controlled by existing requirements, procedures and documentation.
200607856	02/09/2006	En route	Bovingdon (BNN)		EGTT : London (FIR)	AIRBUS	Turbofan	2	PAN declared with nr2 engine shutdown due to high oil temperature indication.	During climb, a 'Nr2 Eng High Oil Temp' advisory message was displayed. Temperature settled at 1250deg C in cruise but, during descent, an associated ECAM warning was received, which resulted in the nr2 engine being shut down. As the a/c was about to enter the hold a PAN was declared, a priority approach was obtained and the a/c landed safely with the fire service in attendance.
200608319	15/09/2006	En route	Southend (SND)		EGTT : London (FIR)	AIRBUS	Turbofan	2	MAYDAY declared, due to nr2 compressor vane FADEC failurewarning, followed by nr2 engine stall/shutdown. A/c landed safely at destination with AFS in attendance.	Pax deplaned on stand, by normal means.
200609032	05/10/2006	En route	Cambridge	20nm NW	EGTT : London (FIR)	ATR	Turboprop	2	MAYDAY declared due to engine fire and smoke in the cockpit. RH engine shutdown. A/c returned and landed safely with AFS in attendance. Fuel nozzle failure.	Initial investigation found debris lying in the rear of the engine. Engine removed and routed to overhaul agent forteardown investigation. Initial findings were one of a catastrophic incident within the combustion chamber module rendering most of the module beyond economical repair. Laboratory analysis of the LP blades carried out and fuel pumpouted for test. Subsequent spray pattern tests confirmedthat the primary cause was failure of the nr9 fuel nozzle. At the time of failure, the engine had run 2537.8 hours from overhaul and the fuel nozzles had only been installed8 hours prior to incident. The remains of the engine could be placed together and showed a direct path of destruction from the nr9 nozzle. The fuel nozzle set, supplied via a distributor, was traced back to their last overhauler who was contacted and advised of the findings accordingly.☐ CAA Closure: The hazard is adequately controlled by the actions stated above.
200609128	07/10/2006	En route	Boreham, Essex		EGTT : London (FIR)	EUROCOPTER	Turboshaft	2	Engine chip caption illuminated in flight. Engine replaced.	During the cruise, nr1 engine chip caption illuminated onthe CAD. Power and speed reduced. Fuzz burner used and the caption momentarily extinguished and then returned. Nr1 engine shut down and the aircraft returned to base where asingle engine approach and landing followed. Inspection found both MCDs to be contaminated. Debris removed, oil filter replaced and oil system flushed but during ground run,the caption returned. Aircraft shut down and the engine replaced. The reporter notes the last MCD examination was 89 hours earlier and the last Spectrographic Oil Analysis (SOA) check was 4 hours earlier with analysis results beingnormal.
200609454	18/10/2006	En route	Isle Of Man (IOM)		EGTT : London (FIR)	BOEING	Turbofan	2	LH engine shutdown due to low oil pressure warning. MAYDAY declared and a/c returned after dumping fuel. On landing, LH brakes overheated and two tyres deflated.	Engine removed and sent for shop visit. Advice from OEM suggests coking of TRF scavenge tube. Operators ASR 0236-06refers. The engine has now been through shop visit including test cell run, no additional findings highlighted. ☐ CAA Closure: The hazard is adequately controlled by the actions stated above.
200609632	18/10/2006	En route	Manchester (MCT)		EGTT : London (FIR)	BOEING	Turbofan	2	Trial to prohibit the use of conditional clearances at Manchester allegedly caused distraction on the ADC frequencyduring a MAYDAY emergency.	It is alleged that the requirement to issue clearances and receive readbacks from fire and support vehicles during the aircraft's landing caused the RT to be extremely busy at a time when the crew (who had returned with an engine failure) may have needed to call ATC. Additionally, this high workload resulted in the controller being unable to observe the aircraft throughout its approach and landing. Seealso 200609454.☐ CAA Closure: The reporter was concerned over the trial evaluating operations without the use of conditional clearances, which was being run to satisfy the Airport Authority that the procedures were robust. The RFFShad been consulted at a high level and it was their view that such clearances should not be used, especially in a high pressure situation, and that view remains. Discussionshave taken place regarding the standard of RT procedures by vehicle drivers and initiatives are being employed to improve this.
200609983	05/11/2006	En route	Polehill (POL)	15nm N	EGTT : London (FIR)	HAWKER SIDDELEY	Turbofan	2	PAN declared due to low oil pressure warning and subsequent nr2 engine shutdown. 7700 squawk displayed.	Pilot requested diversion to Hawarden due company reasons. A/c given descent and transferred for Hawarden approach.D&D kept informed at all times of a/c intentions.

200610901	04/12/2006	En route	Berry Head (BHD)	10-15nm S	EGTT : London (FIR)	BAE	Turboprop	2	LH engine torque and EGT fluctuations. Emergency declared. A7700 squawk displayed. A/c diverted. Engine shut down and restarted in descent. Flight crew error. Notice To Pilots (NTP) issued.	LH engine torque and EGT fluctuations with power lever set to a steady cruise position. As the fluctuations continued, the crew retarded the power lever to attempt to stabilise the affected engine but the torque then dropped to between 10 and 20%. Engine shut down and restarted in descent, following which an uneventful approach and landing was carried out, no fault found. The crew were interviewed by the operator to ascertain the compliance of any SOP and QRH procedures during the incident and it became apparent that what had possibly occurred was a function of normal engine operation that had not been managed correctly, thereby leading to this occurrence. The QRH manual has a specific procedure for this type of event and the operator was not satisfied that this had been followed correctly. Notice To Pilots (NTP) issued Dec 2006 reminding crews that high power lever settings coupled with extensively retarded RPM levers will cause high EGT levels and this will generate a TTL response, which if not managed correctly will cause the symptoms as previously seen. See also 200606175.☐ CAA Closure: The hazard is adequately controlled by existing requirements, procedures and documentation.
200611111	10/12/2006	En route	Goodwood (GWC) (West Sussex)	Nr Drayton level crossing (SE of Goodwo	EGTT : London (FIR)	PITTS	Reciprocating	1	UK Reportable Accident: During attempted forced landing following power loss, a/c crashed in ploughed field and overturned. Aircraft destroyed. No injury to one POB. AAIB AARF investigation.	AAIB Bulletin 4/2007, ref: EW/G2006/12/02 - Summary: The pilot carried out a forced landing in the correct attitude and at the correct speed into a ploughed field, following a loss of power thought to have been caused by carburettor icing. Nevertheless, the aircraft flipped over and came to rest inverted. There was no fire. The pilot was uninjured but could not escape from the cockpit. The crew of a Robinson R44 helicopter was in the area and became aware of the accident. They promptly landed close to the aircraft and were able to lift the tail of G-BOXH high enough for the pilot to crawl clear.☐ CAA Closure: No CAA action appropriate.
200611163	08/12/2006	En route	Durham Tees Valley (TD)	10nm E	EGTT : London (FIR)	BAE	Turboprop	2	RH engine failed to restart after routine training shutdown. A/c diverted to Humberside and landed safely. Unfeathering pump failure.	The company investigation has confirmed unfeathering pump failures. TC holder has been informed and confirmed that they were not aware of any previous occurrences. The component is currently monitored as part of the operator's reliability programme with a 300FH Function Check. See also 200611269.☐ CAA Closure: The hazard is acceptable provided the frequency remains low.
200611269	11/12/2006	En route	Durham Tees Valley (TD)	South of MME	EGTT : London (FIR)	BAE	Turboprop	2	LH engine failed to restart after routine training shutdown. A/c diverted to Humberside and landed safely. Unfeathering pump failure.	The company investigation has confirmed unfeathering pump failures. TC holder has been informed and confirmed that they were not aware of any previous occurrences. The component is currently monitored as part of the operator's reliability programme with a 300FH Function Check. See also 200611269.☐ CAA Closure: The hazard is acceptable provided the frequency remains low.
200611447	08/11/2006	En route	Liverpool	60nm SE	EGTT : London (FIR)	LOCKHEED	Turboprop	4	Nr1 engine rpm dropped below 13400 (normal range 13680 to 13960). Engine shutdown and PAN declared. A/c landed safely with AFS in attendance.	Defect could not be reproduced but slightly low rpm was confirmed - propeller governor adjusted accordingly.
200611504	07/12/2006	Manoeuvring	North Stifford		EGTT : London (FIR)	EUROCOPTER	Turboshaft	2	Nr2 engine oil pressure caution illuminated with drop in pressure. Engine shutdown, PAN declared. HP turbine blade failed, with subsequent out of balance leading to oil pipe failure. Engine replaced.	A/c returned and uneventful run-on landing carried out. On inspection, no oil was observed in the sight glass and there was evidence of spatter on the turbine stator and exhaust. Internal oil leak diagnosed, engine replaced. Engine manufacturers investigation carried out. Oil loss attributed to half height failure of an HP turbine blade, with subsequent out of balance leading to oil pipe failure. Engine TSN 2976hrs. The operator is seeking earlier overhaul of remaining engine on a/c. EASA advised.☐ CAA Closure: The hazard is acceptable provided the frequency remains low.
200611611	23/12/2006	Take-off	London-Heathrow - LHR		EGTT : London (FIR)	BOEING	Turbofan	2	PAN declared and aircraft returned following nr2 engine shut down after take-off. Squawk 7700 selected. Aircraft landed safely with no reported damage.	
200700034	02/01/2007	Take-off	Manchester (MCT)		EGTT : London (FIR)	DE HAVILLAND	Turboprop	2	Autofeather system failed to disarm. LH Signal Conditioning Unit (SCU) and LH Remote Control Circuit Breaker (RCCB) replaced.	During initial climb, deselection of autofeather failed to disarm the system. Switch recycled to no effect. QRH actioned and engineers consulted - flight deemed safe to continue. On arrival, test of autofeather system resulted in uncommanded feathering of both nr1 and nr2 propellers. RH feather pump RCCB replaced. Further inspection found that there was inconsistent activation of the LH autofeather system, which on investigation resulted in the LH SCU (p/n 30005-0000-56) being replaced. During subsequent test, the RH alternate feather light and the RH feather pump were again reported to be operating. Further investigation found that the LH RCCB, fed from the LH secondary feeder bus bar, powers the RH feather pump and advisory light and the RH RCCB, fed from the RH secondary feeder bus bar, powers the LH feather pump and advisory light. It was, therefore, deemed that the incorrect RCCB was replaced. Following replacement of the correct RCCB (p/n SM600BA75A1), the a/c returned to service with no repetition of defect. No other fleet a/c reported similarly affected. ☐ CAA Closure: No further CAA action required at this time.
200700087	06/01/2007	En route	North Sea		EGTT : London (FIR)	SIKORSKY	Turboshaft	2	Nr2 engine chip warning. PAN declared. Circuit breaker reset - warning persisted. One Engine Inoperative (OEI) flight established and normal twin engine approach/landing carried out.	The PAN was acknowledged and when Anglia radar requested the a/c to squawk 7700 this came up as 6700, even after being instructed to recycle the squawk. The pilot was then instructed to revert to his assigned squawk 0231, and D&D were informed that the a/c was unable to select 7700 and was continuing flight on squawk 0231. The pilot later requested to try to select 7700 again so as they could attempt to snag the problem on their transponder. This time the transponder selected the correct code. D&D advised. No fault found on ground with transponder. Engine chip detectors examined for debris, with none apparent. Ground run carried out after which chip detectors re-examined, with no debris apparent. Aircraft returned to service with no subsequent chip warnings.☐ CAA Closure: The hazard is adequately controlled by existing requirements, procedures and documentation.
200700804	23/01/2007	Take-off	Manston		EGTT : London (FIR)	BOEING	Turbofan	4	Compressor stall. Take off rejected. Engine failure on take off three days later.	As the engine was advanced for take off, all parameters appeared stable but at approx 40kts and ±1.25 - 1.30 EPR, a loud bang was heard from the RH side of the a/c and the take off was rejected. Borescope inspection of nr3 engine carried out with no defects found and a/c released to service. The subsequent flight was uneventful. Three days later, immediately after rotation, a loud bang was heard from the nr3 engine and an EGT warning activated. Engine shutdown and a/c returned. During initial investigation a pipe was found to be loose on the T2 sensor, which may have contributed to the malfunction. Further investigation, including borescope inspection, was carried out and the a/c was declared serviceable on the following day. A torque check of T2 sensor pipes has since been added to the 'B' check reliability card. See also 200609789, 200609351.
200700889	03/02/2007	En route	Stansted		EGTT : London (FIR)	MCDONNELL DOUGLAS	Turbofan	3	During climb pilot reported shutting down one engine. MAYDAY declared and fuel dumped. A/c returned and landed safely.	
200701801	03/03/2007	Take-off	Birmingham		EGTT : London (FIR)	AIRBUS	Turbofan	2	Nr1 engine low oil pressure warning followed by 'Eng Fail' indication. One fire bottle discharged as precaution. A/c returned for overweight landing. Oil pump failed.	See also 200506200.
200702115	08/03/2007	En route	Tibenham		EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	2	Nr1 engine fire warning illuminated in cruise. Engine shut down as per emergency drill and warning subsequently extinguished. Connector found broken on fire detector - crimp replaced.	
200702182	09/03/2007	En route	LAKEY		EGTT : London (FIR)	FOKKER	Turboprop	2	Flight crew failed to declare an emergency following engine shutdown.	Flight crew shutdown an engine and requested descent but were not declaring an emergency. Range and distances to Leeds Bradford and Manchester given by ATC but the flight crew elected to continue to scheduled destination. ATC then contacted the operator who were allegedly unaware of the situation and requested that they speak to the a/c with regard to destination/declaration of an emergency. The a/c continued to its planned destination at 6100ft and landed safely. D & D were informed. See also 200702555.☐ CAA Closure: No further CAA action practicable.
200702222	15/03/2007	En route	Dean Cross (DCS)	8nm S	EGTT : London (FIR)	BEECH	Reciprocating	2	MAYDAY declared due to double engine failure. One engine subsequently restarted. Aircraft diverted to Carlisle and landed safely.	Subsequent pilot analysis of the event suggested possible lack of fuel management, resulting in a failure to change fuel tanks from main to auxiliary. This caused the main tanks to run dry, possibly causing air or debris from the bottom of the tanks to be sucked into the fuel lines. The aircraft was inspected for water and debris in the fuel, none found. It was noted, however, that only 15 litres of fuel was found in the tanks. This fact, plus a review of the fuel load and flight time figures, indicates that the aircraft ran out of fuel.☐ CAA Closure: No further CAA action practicable.

200702355	19/03/2007	Take-off	EGSS (STN): London/Stansted		EGTT : London (FIR)	LOCKHEED	Turboprop	4	PAN declared due to erratic indications on all four engines. Nr2 shutdown and nrs 1 and 3 ran down during return. Propeller synchrophaser unit failed. AAIB Field investigation.	AAIB Bulletin 5/2008, ref: EW/C2007/03/06 - Summary: Immediately after take-off on a night flight from Stansted to Edinburgh, the flight crew experienced control difficulties and fluctuation of the RPM and power on all four engines. As the aircraft climbed towards 3,000 feet QNH the number 2 engine was observed to be running down. The crew shut the engine down, declared a PAN and prepared to return to Stansted. The remaining three engines continued to suffer from fluctuating parameters throughout the remainder of the flight until, when on final approach with landing flap selected, both the number 1 and number 3 engines appeared to run down. The aircraft landed using the remaining engine. The investigation revealed that the incident was the result of a failure of the propeller synchrophaser.□ CAA Closure: The operator, in consultation with the UK CAA, has amended its procedures to include the checklist items specific for multiple propeller malfunctions on G-FIZU that had been erroneously omitted. They have also informed crews of the incident and of the revised procedures now in force so that they will be able to identify any recurrence in the future and take effective remedial action. A review carried out by the airframe manufacturer confirmed that the number of aircraft remaining in operation with the analogue synchrophaser fitted is extremely low, in the region of 10 aircraft of all types. All operators who may have aircraft with this unit fitted have been informed of this event and requested to ensure that their checklists include the correct actions to take in the event of multiple engine and propeller fluctuations.
200702402	20/03/2007	En route	En Route		EGTT : London (FIR)	EUROCOPTER	Turboshaft	2	Nr2 engine chip caution illuminated in flight.	Use of fuzz burner failed to extinguish caption. Temperature and pressure normal, power reduced to idle on nr2 engine and a/c returned. Power restored for a normal approach and landing. Single small filament type chip found on forward mag plug.
200702555	22/03/2007	En route	Wallasey (WAL)		EGTT : London (FIR)	FOKKER	Turboprop	2	Nr1 engine in-flight shut down. ATC advised but no emergency declared. Aircraft continued to destination and landed without further incident.	See also 200702182. □ CAA Closure: No further CAA action practicable.
200702674	24/03/2007	En route	Southampton (SAM)		EGTT : London (FIR)	BAE	Turboprop	2	Nr2 engine performed erratically on descent and a/c unable to maintain directional control or height. Nr2 engine shut down and MAYDAY declared. ECL actioned. Uneventful landing performed.	Subsequent investigation and strip report revealed that the propeller governor speed sensing pickup had been over adjusted, consequently causing internal damage and governor failure. The unit has been scrapped and a new unit installed. The contracted maintenance provider has been advised and procedures have been amended to ensure full compliance with approved maintenance data.□ CAA Closure: The hazard is acceptable provided the frequency remains low.
200702924	05/04/2007	En route	London-Gatwick - LGW		EGTT : London (FIR)	BOEING	Turbofan	2	RH engine in-flight run down/shut down, MAYDAY declared (later downgraded to PAN). Expeditious approach.	At 11000ft in idle descent, speedbrake was operated to slow aircraft down when the RH generator went off line followed by RH engine run down. MAYDAY declared, aircraft levelled at 8000ft and QRH completed. RH LP fuel pump EICAS status message appeared and expeditious routing given by ATC. Cabin crew were briefed for a precautionary landing and MAYDAY downgraded to a PAN. Uneventful flap 20 landing carried out with fire services on standby. During subsequent investigation, numerous wiring harnesses were replaced but no definitive cause could be identified. The engine, s/n 30750, was removed and sent to the manufacturer's repair and overhaul facility for investigation. Due to testing proving satisfactory, the fuel flow governor and transient pressure and fuel units were returned to vendors for investigation. No contributing faults were found and normal levels of wear observed. Connectors and adjacent wiring checks also carried out on the aircraft but no evidence of incorrect operation found. In summary, the cause could not be identified. The engine was refitted to a fleet aircraft and no repeat events were reported. The engine was again removed for policy reasons in September 2007. Engine IFSD rate (for all causes) is acceptable on this type, at around 0.007/1000 hours. □ CAA Closure: No further CAA action required at this time.
200702949	03/04/2007	En route	Stansted		EGTT : London (FIR)	BAE	Turbofan	4	Nr4 engine shutdown due to oil loss. A/c diverted to Stansted and landed safely.	
200703314	18/04/2007	En route	Bristol International		EGTT : London (FIR)	AIRBUS	Turbofan	2	MAYDAY declared with nr2 engine shut down. 7700 squawk displayed. A/c continued to destination and landed safely.	During descent to FL170, the engine noise changed due to a slight rumble from nr2 engine. Autothrust engaged to flight idle. N2 observed to fluctuate slightly and EGT increased by approximately 40deg. A member of the cabin crew then reported a strange burning smell along with a fog in the cabin. Master caution 'Eng 2 oil filter clogged' warning activated. Pack 2 switched off to eliminate the smell and engine nr2 bleed switched off. While carrying out ECAM actions, pressure fell below 13psi which led to engine shutdown. MAYDAY declared although this was downgraded to a PAN after 5mins. Uneventful single engine approach and landing carried out. Investigation confirmed by manufacturer as nr3 bearing failure. The operator is participating with the manufacturer in order to minimise the potential risk of a nr3 bearing failure. The operators engine oil filter sample program has been expanded to include the full fleet. In addition, the filter change threshold in the Maintenance Programme has been lowered from 4000hrs to 2500hrs to try and detect early signs of bearing failure.□ CAA Closure: No further CAA action practicable.
200703316	18/04/2007	En route	Southampton (SAM)		EGTT : London (FIR)	PIPER	Reciprocating	2	PAN and subsequent MAYDAY declared due to engine/fuel problems. Diversion. On approach, engines became functional, emergency downgraded to a PAN. Low fuel. Refuelling error.	Pilot's report states that when the a/c was established in the cruise, fuel was switched from the inner to the outer main tanks. Overhead Goodwood, the RH engine began to lose power, followed by a reduction in power from the LH engine, which subsequently stopped. MAYDAY was declared, fuel was selected back to the inner tanks, and both engines restarted and became functional. Emergency call downgraded to PAN. A/c landed safely at Southampton with emergency services in attendance. Subsequent investigation revealed that the verbally requested 85 litres of fuel to all four tanks was only delivered to the two inner tanks and this refuelling was not supervised by the pilot. Therefore when the engines began to lose power, the pilot assumed the gaugesto be suspect and that there were genuine engine malfunctions. The operator and the pilot agreed that the refuelling process is to be supervised and fuel orders are to be presented as a written and not a verbal request.
200703530	25/04/2007	En route	En Route		EGTT : London (FIR)	BAE	Turbofan	4	Nr2 engine shut down due to overspeed indication. Diversion to Stansted.	
200703631	29/04/2007	Take-off	Manchester (MCT)		EGTT : London (FIR)	BOEING	Turbofan	2	Multiple birdstrike on rotation. MAYDAY declared and RH engine shut down due to bird ingestion, engine surges/erratic indications and asymmetric swing/violent airframe vibration. Aircraft returned.	Flames evident from tailpipe, EGT spike of 980deg C. Recall drills and QRH actioned. Uneventful flap 20 landing carried out with fire services in attendance. Herons and crows had been observed crossing aircraft path left to right during take-off run, two herons allegedly ingested. Bird remains found on runway. The engine was removed and sent to Rolls Royce. Initial reports indicate that there is minimal damage as a result of the bird strike. DNA testing identified the bird "Carrion Crow average weight 530g 1.16lb". Operator has raised this occurrence with Manchester Airport as an unacceptable risk. □ CAA Closure: The hazard is adequately controlled by the actions stated above.
200703854	04/05/2007	En route	MONTY		EGTT : London (FIR)	BAE	Turboprop	2	RH engine in-flight shut down. Diversion to Manchester. No emergency declared - ATC changed squawk to 7700. Nr1 torque bridge failed.	
200704025	10/05/2007	En route	GURLU		EGTT : London (FIR)	BAC	Turbofan	2	PAN declared with nr2 engine shutdown due to low oil pressure. Direct routing given.	
200704585	24/05/2007	En route	Richmond Park, London		EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	2	Chip1' caution illuminated. Nr1 engine shut down. QRH actioned. Flight proceeded to Blackbushe where the R/W was made available for a run-on landing.	Inspection revealed minor contamination of module 3 scavenge oil. Subject module has run 6:30hrs since overhaul. Awaiting analysis. A/c released back to service.
200704888	25/05/2007	En route	Shobdon		EGTT : London (FIR)	PIPER	Reciprocating	2	PAN declared with RH engine shut down. Full emergency initiated by ATC. A/c diverted and landed safely.	The nature of the engine failure resulted in the engine being removed and sent for repair. Subsequent inspection of the engine at the overhaul agency confirmed that a number of major assemblies were beyond economical repair. The cause was never clearly identified despite the limited support from the manufacturer. □ CAA Closure: No further CAA action practicable.
200704892	03/06/2007	En route	Leman Field (North Sea)	Overhead	EGTT : London (FIR)	SIKORSKY	Turboshaft	2	PAN declared due to suspected engine fire. Fire extinguisher used and engine shut down. Squawk 7700 selected. Flight continued to planned destination and landed safely.	Investigation confirmed that it was a false indication caused by water ingress at the engine bay fire detectors. Suspect heavy rain as the cause. □ CAA Closure: The hazard is acceptable provided the frequency remains low.
200705153	06/06/2007	En route	Morecambe Bay		EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	2	Nr1 engine chip warning illuminated in cruise. Engine shutdown law checklist. A/c returned and landed safely.	
200705203	11/06/2007	En route	Redhill	3 W	EGTT : London (FIR)	BOLKOW	Turboshaft	2	PAN declared with one engine shutdown. A/c diverted to Redhill. Run on landing carried out on the grass area south of the Tower with AFS in attendance.	CAA Closure: Fault confirmed as a maintenance error, which is subject to further investigation by the operator.

200705511	15/06/2007	En route	Carlisle		EGTT : London (FIR)	OTHER	Unknown		RH engine shut down due to oil leak. Full emergency initiated by ATC.	
200705512	18/06/2007	En route	Newcastle (NEW)	60nm SW Newcastle	EGTT : London (FIR)	FOKKER	Turboprop	2	LH engine shut down due to gearbox failure. A/c returned and landed safely.	See also 200712073, 200711869.
200705592	21/06/2007	En route	MAMUL Waypoint		EGTT : London (FIR)	BEECH	Turboprop	2	PAN declared due to nr2 engine oil leak. Engine shut down. A/c returned and landed safely.	
200705876	21/06/2007	En route	Colchester	SW	EGTT : London (FIR)	EUROCOPTER	Turboshaft	2	Nr2 engine MCD warning light illuminated during cruise with associated master warning.	Flight continued at safe single engine condition and fuzzburner system activated but MCD and master warning captions did not clear. Flight continued at single speed and single engine landing carried out. Module 01 MCD found contaminated with 10 strands of metallic debris approx 3.2 x 0.03mm which, following particle analysis, were identified asZ15CN17-03. Oil flushing, filter checks and ground run carried out and aircraft returned to service. Two further chip illuminations occurred over next 4.5 flying hours with fewer particles present but, following discussion with manufacturer, engine was rejected. Engine strip report requested. Total aircraft hours/landings 2072/10520, total engine hours/landings 144/238. See also 200609128.
200705963	01/07/2007	En route	Cambridge	2nm N	EGTT : London (FIR)	EUROCOPTER	Turboshaft	2	PAN declared due to nr1 engine chip warning. Engine shut down, a/c diverted to Cambridge and landed safely with AFSin attendance.	Inspection of chip detector found debris associated with recent engine change. A/c assessed as serviceable.
200706239	09/07/2007	En route	Manchester (MCT)		EGTT : London (FIR)	DE HAVILLAND	Turboprop	2	PAN declared due to nr1 engine shutdown. Aircraft squawked 7700. Later upgraded to MAYDAY. Diverted to Manchester.	CAA Closure: Initial fault investigation identified the Propeller Electronic Control (PEC) to be the causal failure. The PEC was replaced and the aircraft returned to service following satisfactory testing. The defect re-appeared on 19 July 2007, which resulted in the replacement of the dual pulse probe. Data analysis showed that there was a signal loss to the PEC. The PEC, and its control, performed as expected to the loss of signal. Strip reports for the PEC and Dual pulse probe show no defects with these items. The specific cause for the loss of signal could not be positively identified, however, a proposed PEC software changewill attempt to address the signal redundancy issue by providing alternative sensing for PEC reversionary control.
200706493	13/07/2007	En route	Wallasey (WAL)		EGTT : London (FIR)	MCDONNELL DOUGLAS	Turbofan	2	PAN declared due to inability of aircraft to climb or maintain forward speed/flight level. Squawk 7700 selected. Aircraft descended and returned.	CAA Closure: A full investigation was conducted by the operator, and the assigned inspector has not been able to categorically conclude the cause of the incident. It was agreed that an extensive airstest would be required taking consideration that the symptoms experiences may have been caused by icing. No repeat symptoms were experienced concluding that the likely cause of the event was icing. The company has now since liquidated and no further information is available.
200706496	14/07/2007	En route	Luton (LUT)	5nm	EGTT : London (FIR)	EUROCOPTER	Turboshaft	2	Engine chip warning. Engine shut down. Considered diverting to Luton but finally proceeded to planned destination. Landed safely.	
200706742	19/07/2007	En route	Dean Cross (DCS)		EGTT : London (FIR)	DE HAVILLAND	Turboprop	2	Nr1 engine shut down due to propeller overspeed with associated vibration. PAN declared. Uneventful landing. Recurring problem.	Nr1 propeller overspeed at FL200 in cruise and rpm increased to 1060rpm with 850 MCL set on both engines. Nr1 Propeller Electronic Control (PEC) caution indication on CWP and memory drill completed - rpm unable to be controlled butpropeller did feather. PAN declared and nr1 engine shut down iaw emergency checklist. Uneventful landing carried out with fire services on standby. □ CAA Closure: Initial fault investigation for a previous report identified the PEC(Propeller Electronic Control) to be the causal failure. The PEC was replaced and the aircraft returned to service following satisfactory testing. The defect re-appeared on the 19 July 2007, which resulted in the replacement of thedual pulse probe. Strip reports for the PEC and dual pulse probe show no defects with these items. It is consideredthat the reported event was caused due to the current PECsoftware signal handling processing logic. The proposed PEC software change is attempting to address the signal redundancy issue by providing alternative sensing for PEC reversionary control. The PEC software is presently scheduledfor release in December 2008. A programme for its introduction will be established once the availability is confirmed.
200706745	19/06/2007	En route	Chandlers Cross		EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	2	Fuel sender unit malfunction.	Prior to flight, fuel gauges indicated 32%, split betweenfront and rear tanks, which tallied with the pilot's calculations. During flight, the rear fuel tank indication jumped from 15% to 25%. The front tank low fuel light then tentatively flickered with the indication reading 8%(the front tank feeding the LH engine), although the rear tank (feeding the RH engine) still read 12%. At that point the pilot transferred fuel from the rear to the front tank. Two minutes later the RH engine ran down. PAN declared and an uneventful precautionary landing carried out. On ground, the indications were front tank: 8%, rear tank: 25%. The aircraft was subsequently fuelled to a known state and recovered to base. Engineering investigation confirmed a faulty fuel sender which, it is believed, was faulty from the start of the day. Upgraded sender unit fitted. The reporter considers this occurrence is a reminder of the importance of fuel uplift / gauge cross checks. See also 200500546 and200100115.
200706817	11/07/2007	En route	Bristol Filton		EGTT : London (FIR)	AGUSTA	Turboshaft	2	PAN declared with engine shutdown due to high oil temperature indication. Vectors given for visual approach to R/W27. Full emergency initiated by ATC. A/c landed safely.	
200707032	24/07/2007	En route	En Route		EGTT : London (FIR)	BOEING	Turbofan	4	Nr2 engine in-flight shut down.	High nr2 engine vibration during climb, peaking at 4.3 units. On descent, high vibration, surge and overheat. Due to possible excessive damage, check list actioned and engine shut down. During subsequent inspection, metallic particles found in the exhaust / turbine area. Three engine ferry flight carried out to LHR where the engine was due to bereplaced.□ CAA Closure: Engine removed and strip carried out by manufacturer. Two IP compressor outlet guide vane (OGV) retaining feet were found to have been released. There have been previous occurrences of the event which is caused by wear between the OGV feet and the anti-fret liner in the shroud ring. The manufacturers SB 72-F026 in July 2006 addresses the wear between these components by minor geometry changes to the OGV feet and hard coating of the contact surfaces.
200707070	27/07/2007	Approach	Farnborough		EGTT : London (FIR)	PIPER	Reciprocating	2	LH MLG unsafe indication. Flypast inspections confirmed gear appeared down/locked. MAYDAY declared and diverted to Farnborough due to low fuel state. LH engine shutdown on short finals.	A/c on positioning flight following maintenance. Following landing gear extension, the LH MLG indicated red 'in transit' and the gear handle failed to return to the neutral position. ECL actioned and attempts to lower the gear manually were unsuccessful. Flypast inspections carried out which confirmed the gear appeared down and locked, however only 2 greens obtained on flight deck. MAYDAY declared and diverted to Farnborough due to low fuel state. A/c landed safely and shutdown on R/W.□ CAA Closure: Subsequent to the investigation, both actuating jacks for the nose and main landing gear were removed for maintenance, resealed and refitted. The landing gear was inspected for rigging and retraction tests were undertaken. Since the incident there has been no reported recurrence
200707173	31/07/2007	En route	SKESO	Bearing 200 Range 2nm	EGTT : London (FIR)	LEARJET	Turbofan	2	LH engine shut down due to in-flight fire. Both fire bottles fired. MAYDAY declared. Squawk 7700 selected. Diversion to Exeter. Uneventful landing.	LH engine ITT observed to climb to 950deg C. Reduced to idle but ITT remained high. LH engine shut down. ITT still remained high, causing flight crew to suspect a fire. Bothfire bottles discharged but ITT fluctuated between 950degand 1060deg. Non-containable fire suspected. MAYDAY declared and diversion to Exeter carried out. After landing, the engine was inspected and no evidence of fire was found.Data was downloaded from the DEEC and no evidence of ITT overtemp was recorded. The ITT engine harness was considered suspect (giving erroneous ITT indications) and was replaced. There have been no further reports of excessive ITT.□ CAA Closure: The hazard is acceptable provided the frequency remains low.
200707697	14/07/2007	Manoeuvring	Old Warden		EGTT : London (FIR)	DE HAVILLAND	Reciprocating	1	Engine stopped during aborted stall turn.	At the end of a low level aerobatics sequence, the aircraft failed to yaw to the left when the turn was attempted. A tailslide to a hammerhead followed and the aircraft fellto approximately 45 degrees beyond the vertical. The aircraft was recovered to level flight at approximately 100ft.The engine stopped during the manoeuvre and the aircraft was forced landed in a nearby sports field. The owner/operator has issued a reminding internal order that all low level stall turns should be 'with the engine'.
200707736	14/08/2007	En route			EGTT : London (FIR)	BOEING	Turbofan	2	PAN declared due to LH engine failure. A/c diverted to Stansted.	
200708597	29/08/2007	En route			EGTT : London (FIR)	BOEING	Turbofan	4	EICAS 'Eng 1 Oil Press' message displayed. Pressure indicating below red line limit. QRH actioned. Nr1 engine shutdown, fuel dumped and a/c returned.	

200708912	12/09/2007	En route	Tilbrook (Bedfordshire)		EGTT : London (FIR)	JABIRU	Reciprocating	1	UK Reportable Accident: MAYDAY declared due to engine vibration/power loss. A/c went through hedge during forced landing. Substantial damage. No injury. AAIB Field investigation.	CAA Closure: During flight, the pilot noticed the sudden onset of vibration from the engine. Whilst on the approach to a field for an emergency landing, the engine stopped. Examination of the engine revealed that the nr3 cylinder exhaust valve had failed in fatigue and that the remaining three exhaust valves had fatigue cracks in the same areas as the valve that had failed. The engine had operated for 121 hours since it was manufactured and had Jabiru Service Letter JSL 002-1 entitled 'Jabiru Engine Economy Tuning' embodied. The metallurgical examination of all four exhaust valves indicated a very similar failure mode and fatigue cracking to another Jabiru engine. The similar engine had operated for approximately 300 hours since the valves had been replaced and also had Jabiru Service Letter JSL 002-1 embodied. AAIB Bulletin 05/2010, Ref: EW/C2007/09/12.
200709501	27/09/2007	En route	RATUK		EGTT : London (FIR)	MITSUBISHI	Turboprop	2	PAN declared due to engine control problems. Engine icing suspected. Precautionary descent and destination weather information given. SSR 7700 selected.	
200709659	02/10/2007	En route	London-Gatwick - LGW		EGTT : London (FIR)	BOEING	Turbofan	2	LH engine failed descending through 4000ft. QRH actioned, engine shutdown and MAYDAY declared. A/c landed safely with AFS in attendance.	All components (TPU, BVCU, FFG and pump) were removed and sent for test to the respective manufacturers. Investigation reports indicated that no faults could be found with any of these units. All units were replaced on this particular engine and full power engine runs carried out successfully. The aircraft is no longer on the UK register. □ CAA Closure: No further CAA action practicable.
200709916	14/09/2007	Approach	Manchester Barton A/F		EGTT : London (FIR)	ENSTROM	Reciprocating	1	Noise/rattle behind cockpit. Forced landing in a field. Investigation revealed the lower jack strut bearing for the drive belt system had failed. □ CAA Closure: The lower jack strut pulley bearing was found partially seized and brinnelled. Bearing replaced.	The aircraft had levelled off at 500ft in a circuit when a slight noise/rattle from behind the cockpit became apparent. With the noise continuing to increase, the instructor took control and entered autorotation followed by a safe engine off landing in a field. No injuries to two POB.
200710250	18/10/2007	En route	En Route		EGTT : London (FIR)	DORNIER	Turboprop	2	RH engine vibration and engine fire warning. Engine shut down. PAN declared, a/c diverted. No evidence of fire but damage to outer front cowling noted.	Subsequent investigation by the operator concluded that it is likely that an operative from the organisation had left this cowling open, although no such admission has been made. A Quality Notice has been written to highlight this incident and additional training has been added into the Continuation Training Programme, due to commence in March 2008. □ CAA Closure: No further CAA action practicable.
200710253	04/10/2007	Take-off	Warton		EGTT : London (FIR)	PIPER	Reciprocating	2	During initial climb, a large amount of oil was observed to be leaking from the nr2 engine. Engine shutdown and propeller feathered. MAYDAY declared and a/c returned with RFFS in attendance.	Inspection revealed that the oil leak was due to a popped dipstick. ADD raised to fit a screw type dipstick to this a/c and the rest of the fleet. Notice to Aircrew issued regarding a/c walk round checks. See also 200710290.
200710284	17/10/2007	En route	Northampton - Sywell		EGTT : London (FIR)	ROBINSON	Reciprocating	1	Engine shut down during autorotation practice in flight.	Practice autorotation and power failure recovery being planned, but on commencement when the throttle was rolled off, the engine stopped. Engine off landing carried out. During subsequent investigation at idle rpm, the engine was found not to be smooth. Subsequent investigation and ground run carried found engine to be running roughly. Air induction inspected with O-rings and gaskets replaced. Both magnetos inspected with retard points replaced. Exhaust assembly inspected and replaced due to evidence of burning. Inlet valves inspected iaw SB301 with no faults found. Exhaust valves inspected iaw SB388 and reamed to 0.018 inch. Fuel flow check carried out and blockage found on cylinders 1 and 3. Fuel flow dividers sent for repair/bench test and 1 and 3 confirmed blocked. Dividers cleaned inspected and bench tested. Refitted to engine on return from repairs. Engine runs carried out satisfactorily. □ CAA Closure: The hazard is acceptable provided the frequency remains low.
200710347	19/10/2007	En route	London-Gatwick - LGW		EGTT : London (FIR)	BOEING	Turbofan	2	On reducing thrust at ToD, nr1 engine ran down to sub-idle condition and would not respond to thrust lever movement. QRH actioned. Engine shutdown. PAN declared. Fuel control unit problems.	This event was the subject of a detailed investigation by the operator and the Part 145 organisation that had maintained the fuel control unit (FCU). The operator had taken appropriate action to mitigate any further incident by quarantining the suspect FCUs maintained by the maintenance organisation. Subsequent investigations confirmed that the lack of throttle response on the three main engine control units was attributable to leakage across the pressure and dump valve, resulting from yielding of the valve piston sleeve at the port end. The root cause of this yielding cannot be clearly identified, although the tooling used during maintenance for the removal of the sleeve may be suspect. □ CAA Closure: A Temporary Revision has been raised to the CMM to require a limit to the depth to which the removal tool should be inserted into the sleeve, to minimise the risk of introducing distortion. There also appears to have been some ambiguity in the CMM with respect to the requirement for the drain plugs to be installed for testing of the valve, which is being addressed. The test with the plugs installed will identify deformation in the sleeve. It appears that the subject main engine control units tested had these plugs removed for test. The Part 145 organisation has amended its processes to require that all sleeves are replaced with new on removal, and to require that the drain plugs are installed prior to test. Nine in-service units were identified as being at risk, three of which were found to have exceeded 100 cycles and were hence beyond their risk life of <50 hrs. The other six were returned and their sleeves replaced. There have been no further reports to date. EASA have been informed of these events.
200710413	20/10/2007	En route	Mergate Hill (Norfolk)		EGTT : London (FIR)	JABIRU	Reciprocating	1	UK Reportable Accident: Smoke filled the cabin 5 mins into flight. Engine seized. Forced landing in field. NLG bent, indentation to underside of a/c nose. 1 POB, no injuries. AAIB Field investigation.	CAA Closure: Two aircraft with Jabiru 2200 engines fitted suffered similar engine failures. Both engines had achieved less than 50 hours of usage since they were manufactured. The failures were caused by high temperatures generated within the cylinders causing softening of the piston material which led to the piston rings becoming trapped in their grooves. This allowed engine lubricating oil and/or oil vapour to enter the combustion chamber which allowed pre-ignition to occur, leading to burn-through of the piston crown. Once the burn-through was severe enough, combustion gases entered the engine crankcase which pressurised it forcing the engine lubricating oil to be expelled overboard via the engine exhaust and crankcase breather tube. Both engines had been modified at manufacture to comply with Jabiru Service Letter JSL 002-1 titled 'Jabiru Engine Economy Tuning' which introduced lean burn jets into the carburettor. This investigation was conducted in parallel with the investigation into another Jabiru, also published in this bulletin. AAIB Bulletin 05/2010, Ref: EW/C2007/10/02.
200710696	30/10/2007	En route	Bodmin		EGTT : London (FIR)	OTHER	Reciprocating	1	Aeroprakt A22 Foxbat microlight suffered engine failure after take off. Pilot elected to make a forced landing in a field. One POB, no injuries and no reported damage to aircraft.	
200711225	14/11/2007	En route	Plymouth	Nr	EGTT : London (FIR)	DE HAVILLAND	Turboprop	2	Nr1 engine shut down due to oil pressure loss.	Approaching destination, master warning light illuminated accompanied by fluctuating and falling oil pressure. Nr1 engine shut down iaw QRH, PAN declared and an uneventful single engine landing carried out. Full emergency declared for arrival. Subsequent manoeuvring impeded by unserviceable nose wheel steering. Aircraft shut down on taxiway and towed to stand. Subsequent investigation and strip report confirmed failure of bull gear in the reduction gear box (RGB) due to spalling debris becoming trapped in gear teeth during operation. Bull gear 'expanded' post failure and scored inside of RGB releasing magnesium debris that blocked scavange filters. This probably restricted flow to oil pump, leading to loss of oil pressure due to cavitation of the pump. This is an unusual failure, but considered to be result of deterioration due normal spalling of gears over time. □ CAA Closure: The hazard is adequately controlled by the actions stated above.
200711255	15/11/2007	En route	Trent (TNT)		EGTT : London (FIR)	BRITTEN NORMAN	Reciprocating	3	PAN declared due to RH engine failure.	Loud bang heard from RH engine and the aircraft yawed to the right. Autopilot cancelled. Propeller feathered and the flight continued to an uneventful asymmetric landing. Initial engineering inspection revealed oil in the fairing and a cracked crankcase. □ CAA Closure: On examination by an FAA approved facility, it was found that the crankshaft had failed. They stated that the crankshaft was so badly damaged the reason for failure could not be identified. Since then the maintenance organisation has ceased trading therefore no further progress can be made in determining the cause of the failure.
200711385	19/11/2007	En route	Cranfield (CIT)		EGTT : London (FIR)	DIAMOND	Reciprocating	2	RH engine shut down during air test due to fire warning. Aircraft landed immediately. Suspect false warning due to defective fire warning sensor.	During air test (with engineer onboard following RH engine cylinder replacement) RH engine fire detector warning light illuminated on PFD. No obvious signs of fire observed but engine shut down and aircraft landed without further incident. Engine inspected and no evidence of fire found. Defective fire warning sensor suspected and replaced. Air test to be carried out. Total aircraft hours 457.2, total aircraft hours since overhaul 457.2. Manufacturer advised. See also 200710763.
200711401	14/11/2007	Approach	Blackpool (BPL)		EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	2	Single engine approach and landing following in-flight engine shut down. Full emergency declared by ATC and fire services deployed.	Helicopter ground taxied back to pad with fire services in attendance. □ CAA Closure: On return to base, the nr2 engine, which was on reduced 5hr inspection periodicity due to an earlier chip light occurrence on the 12 Nov 2007, was inspected and subsequently required the rejection of the engine due to high metallic particle contamination. Engine replaced and the a/c returned to service. The strip report published confirmed bearing wear plus minor axial corrosion.

200711543	21/11/2007	En route	Norwich	4 SW	EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	2	RH engine chip caption illuminated on CWP during airstest following 100/300hr inspections. FRC actioned, engine shutdown. A/c returned and landed safely.	A slight sliver of metal was found on the lower chip detector. The reporter states that this is a common incident following 300hr inspection and cleaning of the nr6/7 bearing strut. Ground run and flight test carried out with no further recurrence.
200711547	17/05/2007	Take-off	Elstree		EGTT : London (FIR)	DIAMOND	Reciprocating	2	Power / rpm oscillation on initial climb. PAN declared. Engine shut down. Aircraft returned.	Following a maintenance check, pre-flight checks carried out with no abnormalities noted. Fuel straining had revealed a few small black particles on the first few drops but no water. Engine testing was normal prior to an uneventfultake-off. At approximately 150ft during the climb the LH engine started to surge while still on full power, with oscillations of approximately 20% (i.e. from 100% to 80% repetitively) and associated yawing oscillations. No engine indication abnormalities were noted. LH engine power reduced to 50% and power stabilised. PAN declared. Power reducedon RH engine to maintain speed. Pre-landing checks were being carried out when LH engine rpm increased to 2710rpm. LH engine power reduced to idle and LH engine master switch selected to 'Off'. While necessary drills and checks were being carried out, a shower of 'slightly yellowy' water squirted from the RH air vent over the pilot's head and glasses, impeding his vision (he was seated in the RH seat).Control handed to pilot in LH seat. Uneventful single engine landing followed. The following day, post rectification, a further air test was flown in which a repeat of the previous day's malfunction occurred. On that occasion, power was reduced to 30% to prevent propeller overspeed. Engine manufacturer contacted as initial ground runs were unable to reproduce fault. On their advice, the propeller control valve pressure was adjusted and an air test carried outbut fault recurred with engine over speeding. Boost valveand propeller control valve replaced and engine ground runs carried out with results sent to manufacturer. Defect persisted. Manufacturer then asked for the left and right propellers to be transposed. This was accomplished and engine ground runs and second air test carried out. Engine found to be normal/serviceable. Manufacturer was copied with flight test data. No further reports. See also 200701233 and other related occurrences contained therein.□ CAA Closure: The hazard is adequately controlled by the actions stated above.
200711756	29/11/2007	En route	Haslemere		EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	2	MAYDAY declared due to nr2 engine problem. Pilot subsequently reported engine stabilised but a smell of burning although no flames apparent. A/c diverted to Goodwood and landed safely.	CAA Closure: Investigation revealed that there was a total loss of oil due to the oil filter bowl splitting on the engine. The engine was subsequently removed and replaced.
200711843	03/12/2007	En route	North Sea		EGTT : London (FIR)	AIRBUS	Turbofan	4	Nr2 engine shutdown due to high oil temperature caution. Straight-in approach requested. PAN declared at ATC's request.	Nr2 ECU replaced.□ CAA Closure: Investigation revealed that there was a failure of the ECU, caused by the insufficient support of a flexible cable linking the pressure sub-system to the main portion of the ECU, causing chafing. Subsequent arcing led to the spurious high oil temperature ECAM message experienced during flight. The ECU was returnedfor investigation and initial shop findings did not seem to correlate with the problems experienced in flight. However, further investigation revealed that the flexible cable linking the pressure sub-system to the main portion of the ECU showed signs of chafing and subsequent arcing. The manufacturer advised that this is a known issue on early ECUs where sufficient support was not supplied for the flexible cable, leading to the formation of micro-cracks whichresulted in intermittent power loss and spurious indications. Service Bulletins 73-0130 and 73-0092 have been released to rectify this, either of which can be embodied to rectify the problem. However, the manufacturer also stated that this is normally experienced on the -7B engine and this is the first recorded occurrence on the -5C. The operator is embodying SB 73-0092 on an attrition basis and, as this is the first occurrence of this fault on this engine type, is acceptable that this modification be accomplished in this manner. However, they will monitor for any further occurrences and escalate the modification as necessary.
200712073	05/12/2007	En route	Coventry		EGTT : London (FIR)	FOKKER	Turboprop	2	On transfer to Coventry ATC, pilot reported engine problem, which was quickly amended to nr1 engine shutdown due togearbox problem. ATC declared full emergency. Aircraft landed safely.	ATC asked the pilot if he wished to declare an emergency.This was declined. Investigation ascertained that nr1 engine gearbox low oil pressure light illuminated intermittently. Subsequent inspection found the nr1 low oil pressure switch to be loose. Switch removed, inspected and re-installed, following which engine ground runs were satisfactoryand the aircraft was released to service. See also 200711869, 200705512.□ CAA Closure: No further CAA action required at this time.
200712663	30/12/2007	En route	Mayfield (MAY)	5nm E	EGTT : London (FIR)	DIAMOND	Reciprocating	2	PAN declared following in-flight engine shut down due to high temperature. A/c diverted. Auxiliary drive belt failure	Loss of the RH engine was due to the failure of the auxiliary drive belt. As a result, the water pump no longer worked to cool the engine which caused the engine to severelyoverheat. The failure of the belt was due to an engine mounting bolt migrating and getting trapped, causing the belt to jump sideways two to three grooves on the V-ribbed belt. The belt running with a section off the pulleys then failed around the circumference. This caused the rest of the belt to be pulled off the pulleys. The bolt in question was found loose in the bottom of the cowlng. The maintenance organisation has since advised the TC holder. On Closure, there other reports of this type of failure, however 200801660 (18.2.2008) describes loose engine mount bolt found during inspection.□ CAA Closure: No further CAA action required at this time.
200712944	12/11/2007	En route	Liverpool Bay		EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	2	Nr2 engine chip light illuminated in cruise. Checklist actioned, engine shutdown and a/c returned. During taxi in, passenger in rear row reported fuel leaking into a/c. AFS deployed.	
200800016	02/01/2008	En route			EGTT : London (FIR)	BOEING	Turbofan	4	In cruise at FL220, nr1 engine fire detector (nacelle temperature monitor) spiked, activating fire bell but not warning light. Precautionary engine shutdown carried out.	Fault traced to chafing of cables to close to 'A' and 'B'firewire connectors. Cables poorly routed/secured.
200800263	11/01/2008	Approach	Bristol International	8 E	EGTT : London (FIR)	SAAB	Turboprop	2	SB20 declared an emergency at 1nm final. RFFS initiated. A/c landed successfully and flight crew advised tower thatthey had a problem with Nr2 engine and had shut it down.	Prior to declaring an emergency, the a/c was observed to have descended to 2100ft from cleared altitude 2500ft. ATCcontacted the a/c, which climbed back to 2500ft. Standardseparation maintained. Pilot apologised for the error before being transferred to the tower. After landing, the a/cvacated R/W27 and was held on Taxiway G for investigationby RFFS with both engines shutdown. Full emergency subsequently stood down and taxiway G re-opened.
200800385	14/01/2008	En route	Portsmouth		EGTT : London (FIR)	DASSAULT	Turbofan	2	Lightning strike. Engine ran down.	Aircraft struck by lightning twice while briefly enteringthe base of the cloud when skirting a heavy shower. RH engine ran down with associated engine indications and aircraft yaw. Throttle returned to idle, RH ignitor selected and gently advanced to full power with normal engine response. PAN declared and the aircraft recovered to base.
200800448	17/01/2008	Approach	EGLL (LHR): London/Heath row		EGTT : London (FIR)	BOEING	Turbofan	2	UK Reportable Accident: Engines failed to respond to power demands. A/c lost speed and landed short of runway. A/c destroyed. 152 POB - 1 serious and 12 minor injuries. AAIBFormal investigation.	CAA Closure: Whilst on approach, at 720ft agl, the RH engine ceased responding to autothrottle commands for increased power and instead the power reduced to 1.03 Engine Pressure Ratio (EPR). Seven seconds later the LH engine power reduced to 1.02 EPR. This reduction led to a loss of airspeed and the aircraft touching down some 330m short of the paved surface of the runway. The investigation identified that the reduction in thrust was due to restricted fuel flow to both engines. It was determined that this restriction occurred on the RH engine at its Fuel Oil Heat Exchanger(FOHE). For the LH engine, the investigation concluded that the restriction most likely occurred at its FOHE. However, due to limitations in available recorded data, it was not possible totally to eliminate the possibility of a restriction elsewhere in the fuel system, although the testing and data mining activity carried out for this investigation suggested that this was very unlikely. Further, the likelihood of a separate restriction mechanism occurring within seven seconds of that for the right engine was determined to be very low. The investigation identified the following probable causal factors that led to the fuel flow restrictions: 1) Accreted ice from within the fuel system (referring to the aircraft and engine fuel system upstream ofthe FOHE) released, causing a restriction to the engine fuel flow at the face of the FOHE, on both of the engines, 2) Ice had formed within the fuel system from water that occurred naturally in the fuel, whilst the aircraft operated with low fuel flows over a long period and the localisedfuel temperatures were in an area described as the 'sticky range', 3) The FOHE, although compliant with the applicable certification requirements, was shown to be susceptible to restriction when presented with soft ice in a high concentration, with a fuel temperature that is below -10°C and a fuel flow above flight idle, and 4) Certification requirements, with which the aircraft and engine fuel systemshad to comply, did not take account of this phenomenon asthe risk was unrecognised at that time. Eighteen Safety Recommendations have been made, three being addressed to the aircraft manufacturer, one addressed to the aircraft manufacturer/engine manufacturer, two addressed to EASA, three addressed to the FAA and nine to the FAA/EASA. See AAIB Bulletin 2/2010, Ref: EW/C2008/01/01 and AAIB Aircraft Accident Report: 1/2010.
200800555	17/01/2008	Take-off	Oil Rig (North Sea)		EGTT : London (FIR)	SIKORSKY	Turboshaft	2	Loss of take-off power on lift off from offshore installation. Hazard. Recurring fault.	On departure from the Viking K at night with a/c AUW 10,298lbs, 'wind from starboard by vessel at the K was N 10kts'. A/c maxed out at 100% torque and struggled to achieve 15ft decision height. Investigation progressed under 200710987. See also 200704728, 200206150,
200801243	10/02/2008	En route	Sleap	7nm N	EGTT : London (FIR)	EUROCOPTER	Turboshaft	2	Nr2 engine chip caption illuminated in flight. Engine shutdown and uneventful single engine landing carried out at destination.	Chip detectors examined and samples taken for analysis. Oil drained, filter replaced and system replenished. Groundrun carried out with no further indications. Symptoms recurred two days (2.5 flying hours) later with a large quantity of metallic debris being removed from the nr2 MCD. Theengine was replaced and analysis confirmed the particles to be bearing steel material.
200801980	27/02/2008	En route	Nottingham East Midlands		EGTT : London (FIR)	PIPER	Reciprocating	2	PAN declared due to engine failure. Aircraft diverted.	

200802219	07/03/2008	Take-off	London-Gatwick - LGW		EGTT : London (FIR)	BOEING	Turbofan	2	Loss of LH engine thrust on take-off.	Following a normal take off-roll, a significant yaw developed on rotation due to a loss of thrust from the LH engine. LH engine NI dropped to approximately 83% and failed to increase with manual selection. Flight control was maintained and departure continued. PAN declared. All other engine parameters were normal with no EICAS or status messages. ATC were advised that a return to the departure airport was being initiated following fuel jettison. QRH actioned but then the LH jettison transfer valve failed. Flap 5 selected to increase fuel burn. Up until this point, the LH engine had operated normally at holding thrust but when thrust was reduced for flap deployment and then increased to maintain speed, the LH engine failed. QRH actioned and MAYDAY declared followed by a safe single engine overweight landing. <input type="checkbox"/> CAA Closure: Extensive investigation found the fuel pump had suffered internal drive shaft bearing failure, which caused it to seize, and the engine to 'flame out'. Primary failure of the component was caused by corrosion contamination. Failure of the left jettison/transfer valve caused by the valve actuator motor burning out. Previous maintenance on this component reported no defects evident. The operators reliability dept will continue to monitor any further failures of this nature.
200802627	13/03/2008	En route	London-Gatwick - LGW		EGTT : London (FIR)	AIRBUS	Turbofan	2	Engine vibration due to icing conditions.	Shortly after take-off engine anti-ice was switched on due to the a/c entering icing conditions. After levelling at FL310, in cloud tops, ice rapidly built up on ice indicator so wing anti-ice was switched on. Shortly thereafter vibration was felt and indicated N1/N2 vibration increased on both engines until ECAM advisory displayed. Repeated requests to climb denied due traffic. When climb eventually achieved, engine vibration slowly decreased. LH engine vibration peaked at 7.1, RH at 5.2, reducing to 4.0 and 2.1 respectively by top of descent. Vibration returned to normal at low level. Both engines inspected by engineer on ground, no evidence of ice or damage found.
200802655	17/03/2008	En route	Southend (SND)		EGTT : London (FIR)	PIPER	Reciprocating	2	PAN declared due to engine shutdown. Subsequently restarted engine and landed normally. Fire services deployed.	
200803019	30/03/2008	Approach	Biggin (BIG) (Kent)		EGTT : London (FIR)	CESSNA	Turbofan	2	UK Reportable Accident: A/c crashed into housing estate during in-flight return due to perceived engine vibration. A/c destroyed by fire. Five POB, all with fatal injuries. AAIB Formal investigation.	CAA Closure: The aircraft departed Biggin Hill for a private flight to Pau, France but shortly after take-off initiated a return to Biggin Hill after reporting engine vibration. During the downwind leg for Runway 21, the aircraft descended. The flight crew reported a major power problem just before it struck the side of a house. An intense fire developed. None of the two flight crew and three passengers survived. <input type="checkbox"/> The following contributory factors were identified: <input type="checkbox"/> 1. It is probable that a mechanical failure within the air cycle machine caused the vibration which led to the crew attempting to return to the departure airfield. <input type="checkbox"/> 2. A missing rivet head on the left engine fuel shut-off lever may have led to an inadvertent shutdown of that engine. <input type="checkbox"/> 3. Approximately 70 seconds prior to impact, neither engine was producing any thrust. <input type="checkbox"/> 4. A right attempt on the second engine was probably started before the left first engine had reached idle speed, resulting in insufficient time for enough thrust to be developed to arrest the aircraft's rate of descent before ground impact. <input type="checkbox"/> Three Safety Recommendations, nrs 2010-014 and 2010-15, addressed to the Federal Aviation Administration, and 2010-016 addressed to ICAO have been made. <input type="checkbox"/> See AAIB Aircraft Accident Report: 03/2010, Ref: EW/C2008/03/03.
200803065	22/03/2008	Take-off	London-Heathrow - LHR		EGTT : London (FIR)	BOEING	Turbofan	4	Engine surge during initial climb. ATC reported flames from nr1 engine. MAYDAY declared (later downgraded to PAN). Engine shutdown. Fuel dumped and a/c returned.	Following a full power take-off, an engine surge was detected by the crew during initial climb and ATC reported "engine one on fire". QRH actions carried out, during which late autopilot selection led to flap exceedance. Once stable flight established and QRH actions completed, company contacted and fuel jettisoned in preparation for return. Uneventful three engine approach and landing carried out. <input type="checkbox"/> CAA Closure: During flight, a gear monitor message was set indicative of a fault with RH wing gear downlock primary sensor, or its wiring. A BITE test was carried out which proved satisfactory. On the subsequent sector, another gear monitor message was set with the same fault code. Testing was carried out upon arrival and cleared as previously. The aircraft was released under MEL reference 31-61-4 as the associated equipment was operating normally at time of dispatch. It was agreed that the correct MEL reference had been used.
200803088	25/01/2008	En route	Liverpool		EGTT : London (FIR)	PIPER	Reciprocating	2	RH engine shut down due to low oil pressure. MAYDAY declared. Diversion. Turbocharger failure.	Investigation revealed that turbocharger bearings had failed causing severe damage to impeller and turbine sections and an excessive oil leak. Turbocharger p/n 409170-9001. Total component hours, 1475. Total component hours since Check 1 inspection, 52. <input type="checkbox"/> CAA Closure: Considered to be an isolated incident.
200803107	01/04/2008	En route	En Route		EGTT : London (FIR)	ATR	Turboprop	2	Nr2 engine failure/shutdown. PAN declared. Full emergency initiated by ATC. A/c returned and landed safely.	
200803400	10/04/2008	En route	London-Heathrow - LHR		EGTT : London (FIR)	AIRBUS	Turbofan	2	PAN declared due to loss of oil pressure on nr2 engine. Autothrust disengaged and nr2 engine reduced to idle power. Single engine, flap 3 approach made and normal landing carried out.	
200803604	13/04/2008	Approach	Blackpool (BPL)		EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	2	Full emergency declared for inbound a/c with one engine shutdown. A/c inbound from the gas rigs landed safely.	CAA Closure: Investigation found a small hair like strand of metal across MPI1 mag plug contacts. MPI2, BMP and RMP mag plugs were free of contamination. Nr1 engine oil filter inspected and also found clean. A 15 minute ground run was carried out and aircraft returned to service. No reported recurrence since.
200803613	15/04/2008	En route	Cardiff		EGTT : London (FIR)	OTHER	Reciprocating	1	Snowbird microlight - Loud bang heard and vibration felt in flight. Pilot switched off engine and performed a successful forced landing. Propeller splintered.	
200804834	12/05/2008	En route	Ware		EGTT : London (FIR)	PIPER	Reciprocating	2	Infringement of Stansted CTA (Class D) by a PA30 at 2000ft. Traffic info and avoiding headings given to two inbound a/c. Standard separation maintained.	PA30 pilot subsequently explained that a/c experienced an engine failure due to fuel starvation (inaccurate fuel gauge) and so he elected to maintain altitude while he resolved the problem. An alternative fuel tank was selected, following which descent was initiated. With hindsight, pilot acknowledges that a call to Stansted would have been prudent, or at least he should have asked Stapleford, who he was in contact with, to advise Stansted of the issue with the engine. <input type="checkbox"/> CAA Closure: Pilot did contact ATC after landing to discuss the incident and apologised for any inconvenience.
200804834	12/05/2008	En route	Ware		EGTT : London (FIR)	BOEING	Turbofan	2	Infringement of Stansted CTA (Class D) by a PA30 at 2000ft. Traffic info and avoiding headings given to two inbound a/c. Standard separation maintained.	PA30 pilot subsequently explained that a/c experienced an engine failure due to fuel starvation (inaccurate fuel gauge) and so he elected to maintain altitude while he resolved the problem. An alternative fuel tank was selected, following which descent was initiated. With hindsight, pilot acknowledges that a call to Stansted would have been prudent, or at least he should have asked Stapleford, who he was in contact with, to advise Stansted of the issue with the engine. <input type="checkbox"/> CAA Closure: Pilot did contact ATC after landing to discuss the incident and apologised for any inconvenience.
200804902	13/05/2008	Take-off	Exeter		EGTT : London (FIR)	PIPER	Reciprocating	2	ATC observed smoke from LH engine during departure. Pilot advised and elected to return. Pilot subsequently reported LH engine shutdown due power loss. A/c landed safely with AFS in attendance.	Initial inspection showed that the crankcase had been penetrated by a con rod and crankcase debris in lower cowling. <input type="checkbox"/> CAA Closure: Engine strip report confirmed that cracked conrod bolt failed, leading to conrod separation and subsequent engine failure.
200804965	17/05/2008	En route	Caernarfon		EGTT : London (FIR)	ZENAIR	Reciprocating	1	On throttling back during descent, cable/linkage snapped. PAN/MAYDAY declared and engine cut to reduce speed. Engine later restarted for deadstick landing. No damage or injury.	
200805289	24/05/2008	En route	Topcliffe		EGTT : London (FIR)	OTHER	Unknown		AAIB Initial Notification: Engine failure due to fuel starvation. Diverted. Landed safely. Evidence of fuel leaking from RH drain valve and possibly from vent.	

200805517	31/05/2008	Take-off	Sellyoak		EGTT : London (FIR)	EUROCOPTER	Turboshaft	2	Nr1 engine chip caption illuminated prior to take-off. 'Fuzz Burn' operated and caption cleared but recurred duringclimb out. Engine shutdown and flight continued to normallanding.	Minor debris found on both mag plugs, samples retained for analysis. Filter clear but oil change carried out as a precaution.
200805735	23/05/2008	Manoeuvring	Headcorn / Lashenden (Kent)	5 W	EGTT : London (FIR)	DE HAVILLAND	Reciprocating	1	UK Reportable Accident: A/c made forced landing in field following engine failure. Landing gear collapsed, lower wing and fuselage damaged. No injury to one POB. AAIB AARF investigation.	CAA Closure: During an aerobatic manoeuvre the engine stopped. While conducting a forced landing, the pilot changedhis selection of field twice and was subsequently unable to make his third choice of field. The pilot deliberately stalled the aircraft onto the ground in a field approximately 100m short of his selected field. The landing gear collapsed and the aircraft was substantially damaged. See AAIB Bulletin 9/2008, ref: EW/G2008/05/38.
200805743	05/06/2008	En route	Southampton (SAM)		EGTT : London (FIR)	BRITTEN NORMAN	Reciprocating	3	Pilot reported rapid RPM fluctuations on the RH engine and subsequently declared a PAN, having shut the engine down.	CAA Closure: The event was caused by a faulty RPM gauge. The component is not currently subject to reliability issues.
200806016	03/06/2008	En route	REDFA	15nm W	EGTT : London (FIR)	AIRBUS	Turbofan	4	PAN declared due to nr1 engine shutdown following loss ofoil pressure. Fuel dumped and a/c returned.	
200806717	25/06/2008	En route	Bradford on Avon (Wiltshire)		EGTT : London (FIR)	PIPER	Reciprocating	1	UK Reportable Accident: MAYDAY declared due to engine failure. Forced landing attempted. A/c ditched in lake. Minorinjuries to one POB. AAIB Field investigation.	CAA Closure: The aircraft was on its first flight after having had two new cylinders fitted to the engine. After approximately 90mins the engine started making an unusual sound and, fearing an imminent catastrophic engine failure or fire, the pilot elected to shut it down and make a forced landing. The aircraft came to rest in a lake; the pilot escaped with only minor injuries. The engine problem was attributed to the rocker for the No 4 cylinder inlet valve becoming detached due to failure of the stud bolts, causing the inlet valve to remain closed. Metallurgical examination of the fractures revealed evidence of a fatigue initiated failure mechanism in both bolts; this could not be attributed to any deficiency in the bolt material. See AAIB Bulletin 09/2009, Ref: EW/G2008/06/02.
200807367	10/07/2008	En route	Polehill (POL)		EGTT : London (FIR)	BAE	Turbofan	4	Nr2 engine oil pressure warning during climb. In cruise nr2 engine oil contents and pressure both continued to fall. Precautionary engine shutdown carried out.	
200807533	09/07/2008	En route	Marham	40 NW	EGTT : London (FIR)	BAE	Turboprop	2	LH engine flamed out during cruise. Shutdown drill completed and flight continued to normal landing. Chip detector and oil filter found contaminated with metal fillings. Engine replaced.	
200807588	16/07/2008	En route	FAMBO		EGTT : London (FIR)	PIPER	Reciprocating	2	MAYDAY declared and RH engine shut down due to low oil pressure. Squawk 7700 selected and D & D alerted. Emergency declaration later downgraded to PAN and flight continued to destination.	
200807662	19/07/2008	En route	Llanfihangel Glyn Myfyr (Clwyd)		EGTT : London (FIR)	AVIONS ROBIN	Reciprocating	1	UK Reportable Accident: Aircraft crashed into a field. Two POB, both serious injury. Substantial damage to aircraft. AAIB Field investigation.	CAA Closure: The aircraft was on the second leg of a seven day journey from France to the United States of America (USA). As it transited over North Wales, avoiding cloud and the high ground, the engine ran down. The pilot had selected the fuel to feed from the left wing tank. The time that had elapsed since that selection indicated that the engine could have suffered from fuel starvation. However, theconditions were also conducive to carburettor icing. The engine could not be restarted and the pilot carried out a forced landing into a field. During the landing the aircraft ran into a bank in the far corner of the field and was substantially damaged. Both crew members were seriously injured. Although there was a significant spillage of fuel, there was no fire. See AAIB Bulletin 09/2009, Ref: EW/G2008/07/01.
200808030	26/07/2008	En route	Coningsby (Lincolnshire)		EGTT : London (FIR)	AERONCA	Reciprocating	1	Engine stopped in flight. Forced landing made in field. Aircraft destroyed. No injury to one POB. AAIB AARF investigation.	CAA Closure: In performing a forced landing in a field, following a complete loss of engine power in flight, the aircraft touched down on a transverse ridge, causing the landing gear to collapse. See AAIB Bulletin 12/2008, ref: EW/G2008/07/25.
200808926	17/08/2008	Approach	Manchester (MCT)		EGTT : London (FIR)	DE HAVILLAND	Turboprop	2	PAN declared due to nr2 engine failure/shutdown.	CAA Closure: Investigation revealed the loss of oil pressure was due to the retaining nut on the oil pump drive side shaft, loosening off. As a result of the failure, the OEM identified a small number of oil pumps that could be affected. The operator has carried out all engine OEM recommendations. The item replaced is highlighted as a concern inthe reliability programme and being suitably tracked.
200809171	23/08/2008	Take-off	London- Gatwick - LGW		EGTT : London (FIR)	BOEING	Turbofan	4	As a/c became airborne ATC observed flames from nr1 engine and advised pilot accordingly. MAYDAY declared, engine shutdown, a/c returned and landed safely.	CAA Closure: Incident found to have been caused by 11th stage HP compressor blade failure, which were to the latestmodification state. Existing boroscope inspections on known defects in this area delete the applicability for the latest mod state blades. Engine sent for strip and report from the manufacturer. The operator will initiate their ownboroscope inspection programme for these blades if the manufacturer does not amend their own programme.
200809225	26/08/2008	En route	Bulkington		EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	2	Nr2 engine fire warning in cruise. Engine shutdown, PAN declared and both extinguishers fired. Warning persisted and haze noted in flight deck. Uneventful precautionary landing carried out.	Investigation found broken wire on engine fuel filter housing fire detector. Crimp replaced and function check of fire detection circuit completed with satisfactory results.
200809559	03/09/2008	En route	Daventry (DTY)	10 SE	EGTT : London (FIR)	AGUSTA	Turboshaft	2	PAN declared during cruise at 2500ft following nr1 engineshutdown due to high oil temperature warn. A/c diverted and landed safely. Inspection revealed a failure of the oilcooler drive belt.	
200809586	15/08/2008	Take-off	Stansted		EGTT : London (FIR)	BOEING	Turbofan	2	Birdstrike on take-off. Nr2 engine shut down and aircraftreturned.	
200809660	07/09/2008	Take-off	Cardiff (CDF)		EGTT : London (FIR)	AVIONS ROBIN	Reciprocating	1	MAYDAY declared due to engine failure at 200ft altitude during the climb. Forced landed into a field. No injuries to one POB. No damage to the aircraft.	CAA Closure: Following investigation, the carburettor float was found to be leaking.
200809910	10/09/2008	En route	London City - LCY		EGTT : London (FIR)	ATR	Turboprop	2	LH engine shutdown due to oil pressure problem. PAN declared. A/c diverted.	
200810077	15/09/2008	En route	London - Area		EGTT : London (FIR)	MBB	Turboshaft	2	Nr1 engine chip warning illuminated during flight.	Emergency procedures carried out. Fuzz burner operated but warning remained illuminated. PAN declared, engine shut down and diversion initiated. Landed safely.
200810108	16/09/2008	Approach	Southampton (SAM)		EGTT : London (FIR)	DE HAVILLAND	Turboprop	2	Nr2 engine shutdown due to low oil pressure warning. Checklist actioned and MAYDAY declared. A/c landed safely withAFS in attendance.	CAA Closure: The results of a detailed visual inspection identified the loss of oil pressure was due to the retaining nut on the oil pump drive side shaft loosening off. Theretaining nut became loose because the locating tang on the locking cup washer failed. Failure of the tang has not been positively identified by the vendor. The operator carried out further inspections of suspected oil pumps identified by the manufacturer.
200810475	23/09/2008	En route	Nottingham East Midlands		EGTT : London (FIR)	BOEING	Turbofan	2	RH engine shutdown due to increasing vibration.	CAA Closure: Extensive troubleshooting carried out with nil findings, vibration sensors replaced and aircraft vibration module tested. Vibration system wiring checked but indicated vibration remained above 2.5 units during ground runs. Engine manufacturer determined from flight data, thatthe likely cause was due to lack of interference between the HP turbine and rear stub-shaft spigot diameters resulting in a temporary misalignment. In addition, it was believed that an intermittent indication defect was contributing to the high vibration level observed. The engine was replaced as was the right engine vibration monitor. Aircraft released back to service after ground runs and tests. No further vibration reports.

200810609	18/09/2008	En route	Bournemouth		EGTT : London (FIR)	DIAMOND	Reciprocating	2	Engine surge / uncommanded shutdown.	Approximately 30 minutes into flight, the engine started to surge slightly. Throttle closed and reset to cruise power due to surge increasing. After a while, the surge recurred significantly. The engine then shut itself down in the feathered position. □ CAA Closure: Following investigation and discussions with Thielert Engines, the maintenance organisation replaced the prop control valve. The aircraft was returned to service after a satisfactory test flight and with no further problems. Additionally, EASA AD 08-110, referencing Thielert TAE SB TM 125-1008 P1 Rail Pressure Valve replacement, has been embodied. This has been issued due to the possibility of uncontrolled engine shut downs, although it was not thought to have been relevant factor in this event. It is believed that the surging caused the FADEC to shut down the engine as a safety feature and the root cause was considered to be a faulty prop control valve.
200810631	29/09/2008	En route	Coventry		EGTT : London (FIR)	DIAMOND	Reciprocating	2	Engine oscillation prior to engine failure.	Following a go-around, the RH engine started to oscillate. Checklist carried out. PAN declared. RH engine then stopped completely. MAYDAY declared prior to an uneventful landing. □ CAA Closure: The event was traced to failure of the propeller control valve. The engine manufacturer have not to date identified the root cause. SB's have been issued previously by the manufacturer, which have been mandated by EASA (AD2009-0151), which call for regular inspections.
200811012	06/10/2008	Approach	Scillies		EGTT : London (FIR)	DE HAVILLAND	Turboprop	2	Pilot reported oil warning light on approach. Go-around flown and a/c returned with RH engine shutdown. A/c landed safely with AFS in attendance.	CAA Closure: The fitter tasked to replenish the engine oil was distracted whilst accomplishing the task. The oil cap was therefore not fully closed on aircraft dispatch. Both supervisor and fitter involved have been interviewed and additional Human Factors training has been undertaken.
200811317	13/10/2008	En route	Nottingham East Midlands		EGTT : London (FIR)	PIPER	Reciprocating	2	Oil leak from LH engine during climb out at FL80. Engine shutdown. Emergency declared and a/c returned. A/c landed without incident. RFFS attended a/c on stand.	Pilot inspection on arrival revealed that the oil dipstick was not secure. Pilot believes that the dipstick was replaced to its secure position during his pre-flight inspection. Engineers inspection confirmed that the oil filler assembly was serviceable. It is believed that the dipstick became detached when the a/c passed FL80. Following a number of similar incidents in 2007, the 'push and clip' oil filler cap/dipstick assemblies are being changed to the 'screw in' type across the fleet. All crews to be advised of this incident via a monthly safety bulletin and annual refresher training.
200811420	17/10/2008	En route	Robin Hood's Bay (North Yorksh		EGTT : London (FIR)	PIPER	Reciprocating	1	UK Reportable Accident: A/c crashed into sea, sank and was destroyed. One POB fatal. AAIB Field investigation.	CAA Closure: The aircraft suffered a loss of engine power whilst over the sea just off the North Yorkshire coast. The pilot transmitted a MAYDAY and attempted to ditch the aircraft, but it stalled just above the surface of the sea, causing its right wing to drop into the water. The aircraft then cartwheeled and inverted before sinking. The pilot, who was not wearing a life jacket, drowned. The cause of the power loss could not be positively determined. See AAIB Bulletin 09/2009, Ref: EW/G2008/10/03.
200811612	22/10/2008	En route	Norwich		EGTT : London (FIR)	SAAB	Turboprop	2	RH generator failed and RH engine shut down. PAN declared. Aircraft returned.	RH generator failed during the climb. Checklist actioned and the APU was started. Amber 'RH Engine High Oil Temperature' then activated at the top of the climb. Checklist completed, RH engine shutdown, PAN declared and the aircraft returned to the departure airport. □ CAA Closure: The generator was removed and sent to the OEM for analysis. Results of the analysis are currently pending. Dependent on the findings, the MOR may be re-opened.
200811994	31/10/2008	Take-off	London City - LCY		EGTT : London (FIR)	BAE	Turbofan	4	Nr3 engine low oil pressure warning illuminated during initial climb. Engine shutdown and PAN declared. A/c diverted and landed safely.	CAA Closure: It was discovered that the nr3 engine oil pump drive shaft had sheared, causing the low oil pressure IFSD event. The oil pump and dual oil heat exchanger were replaced, as well as a check of the various oil system magnetic chip detectors. The only detector that had any debris evident was on the full flow chip detector (FFCD). The oil pump sheared shaft has not been experienced before by the operator who intends to take no further action.
200812190	07/11/2008	Take-off	Manchester (MCT)		EGTT : London (FIR)	AIRBUS	Turbofan	2	Smoke observed from RH engine on rotation. Pilot subsequently declared MAYDAY due to engine failure/shutdown. A/c returned and landed safely with AFS in attendance.	CAA Closure: Investigation revealed high cycle fatigue following stress induced by rotor stator tip rub in the first flap mode during start. This is despite the previous embodiment of SB 72-0449, stage 4 liner trenching. The engine overhaul manual has been amended to require the replacement at shop visit of any HPC stage 4 blades showing signs of tip to stator contact.
200812268	10/11/2008	En route	Manchester (MCT)		EGTT : London (FIR)	BOEING	Turbofan	2	Nr1 engine oil filter bypass caption illuminated and would not extinguish with thrust at idle. Engine shutdown law QRH. PAN declared, a/c returned and landed safely with AFS in attendance.	CAA Closure: The oil scavenge filter assembly was removed for investigation, and it was found that the differential pressure switch failed the function test. Following replacement of the filter assembly, there have been no further inflight related reports.
200812596	15/11/2008	En route	En Route		EGTT : London (FIR)	BEECH	Turboprop	2	RH engine oil pressure decrease and temperature increase accompanied by smell of oil on flight deck. Checklist actioned, engine shutdown and a/c landed safely with AFS in attendance.	Post flight inspection revealed pool of oil beneath RH engine. Investigation found that the oil pressure manifold tee pipe cap had vibrated loose, resulting in the loss of approx one quart of oil.
200812634	21/11/2008	En route	Birmingham		EGTT : London (FIR)	DE HAVILLAND	Turboprop	2	Nr2 engine FADEC caution illuminated in cruise. Checklist actioned, engine shutdown and PAN declared. A/c landed safely.	CAA Closure: The engineering investigation identified Fault Code 912 A&B logged in the FADEC. This code identifies the P2.2 valve as suspected. The aircraft was returned to service and there have been no further occurrences of the reported defect. The Flight Safety issue with this incident is that the ECL does not give enough emphasis between the 2 FADEC failures. It is recommended that the aircraft manufacturer should consider highlighting this issue by highlighting the failures in the ECL by colour. This will identify between a caution and a warning. It is confirmed that the crew completed the incorrect drill in this case, which resulted in an unnecessary engine shutdown.
200812675	20/11/2008	En route	Gloucester- Staverton		EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	2	Engine shutdown due to fire indication. A/c returned and landed safely with AFS in attendance. No evidence of fire - warning assessed as spurious.	Loose fire detector wire identified as the cause.
200812751	24/11/2008	En route	Exeter		EGTT : London (FIR)	DIAMOND	Reciprocating	2	Full emergency called by the pilot due to uncommanded RH engine shutdown. Aircraft diverted. Full emergency procedure initiated by the airport. Aircraft landed safely.	CAA Closure: The engine manufacturer confirmed the cause of the incident to be failure of the engine oil system, piston cooling nozzle in the nr2 cylinder. This is a known problem for which AD 2008-0016R1 was issued. The AD calls for 100hr inspections for which this aircraft was in compliance. The manufacturer has no plans to revise the frequency of the inspections.
200812972	02/12/2008	Take-off	Bristol Filton		EGTT : London (FIR)	PIPER	Reciprocating	2	PAN declared due to LH engine failure on climb out after a go-around. Local standby declared. Aircraft landed safely.	
200813118	07/12/2008	En route	Biggin (BIG)		EGTT : London (FIR)	CESSNA	Reciprocating	1	MAYDAY declared due to complete loss of power while in the cruise. Some power restored and a direct approach given. Landed safely. Subsequent inspection found the throttle cable to be unserviceable.	
200813682	23/12/2008	En route	Haverfordwest		EGTT : London (FIR)	BOLKOW	Turboshaft	2	Nr 2 mag plug illuminated during flight. Engine shut down and single engine flight established. PAN declared. A/c returned. Run on landing carried out with RFFS in attendance.	Inspection found debris on lower mag plug. Engine oil changed and refilled. Engine ground run satisfactory and the aircraft returned to service.
200813905	02/12/2008	En route	Stoney Cross		EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	2	Nr1 engine chip light illuminated in flight. Checklist actioned, engine shutdown and a/c diverted.	CAA Closure: Engine sent for analysis and engine accessory gearbox found to be making metal. Gearbox bearing break up was established as the root cause.

200900655	21/01/2009	Take-off	DP3 Platform	Morecambe Bay	EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	2	Fuel caption illuminated on CWP and 'FILT' illuminated on fuel panel after departure due to nr2 engine fuel filter blockage. PAN declared. Nr2 engine shut down. Diversion.	Fuel filter 'clogging' drill actioned with two unsuccessful attempts to extinguish filter caption by lowering collective and slowly retarding affected engine yellow handle to idle. Uneventful single engine landing carried out with fire services in attendance.☐ CAA Closure: On inspection, the nr2 fuel filter was found to be partially blocked which would have caused the pressure differential switch to activate the fuel filter blocking warning light. There were no visible particles in the filter. This blockage is thought to be directly linked to the AL48 fuel additive. AL48 is a blend of AL41 and AL 61 which together can cause a build up of aluminium linoleate precipitates if the mixture is stood for any length of time and/or comes into contact with aluminium in the fuel tanks. To combat this build up, the operator has changed from the blended AL48 to straightAL41. Once all the fuel is running with AL41 only, the operator will be systematically replacing all the airframe fuel filters so it may monitor the results post changeover.
200901085	06/02/2009	En route	Humberside		EGTT : London (FIR)	SIKORSKY	Turboshaft	2	PAN declared due, ATC believed, to shutting down one engine (transmissions very garbled). Aircraft squawked 7700. Escorted to base by another aircraft.	On climb out, nr1 engine T5 observed at maximum. Climb discontinued and EOPs checked. No procedure for this failure. Engine shutdown as a precaution although faulty temperature gauge suspected.☐ CAA Closure: T5 gauge failed and subsequently replaced.
200902823	29/03/2009	En route	Manchester (MCT)		EGTT : London (FIR)	BRITTEN NORMAN	Turboprop	2	PAN declared with LH engine shutdown. A/c returned.	During a routine flight at 90kts, 60deg AOB, a bang was heard. Aircraft rolled wings level. The banging continued with LH engine torque gauge indicating a reduction from 800to 300/350 before rising rapidly to 800. Aircraft yaw consistent with loss and gain of power. LH power lever reduced to idle, with reduced symptom still present. LH engine shut down. A PAN was declared and the aircraft returned to base.☐ CAA Closure: Following extensive consultation with the engine manufacturer and Rolls Royce and the authorisedmaintenance centre, a decision has been taken to use only-6 orifices in the bleed values. Since moving to this position, no recurrence of a similar nature has been seen. Insufficient data was captured to allow the engine manufacturer to make a definitive technical diagnosis, however circumstantial indications had very strongly indicated that the cause of the incident was the use of a -4 orifice. Higher mod standard bleed valves (-6) have now been fitted to the affected aircraft.
200902826	28/03/2009	En route	Bristol International		EGTT : London (FIR)	BOEING	Turbofan	2	Member of public observed flames from RH engine on departure. Pilot subsequently reported RH engine shutdown. A/c diverted and landed safely. Suspected compressor surge.	Two days later, during the second engine run, two loud bangs were heard and flames observed from the rear of the engine. The aircraft was positioned at 90deg to the wind andengineers requested that the aircraft be positioned onto a taxiway into the wind. The same malfunction recurred on the subsequent run, but on this occasion with parts observed to "shoot out" of the rear of the engine. Inspection revealed a portion of the ice shield, approximately 75cm x 50cm x 3cm, was missing. Parts were recovered from the grass area between two taxiways.
200903044	29/03/2009	Approach	Headon (Nottinghamshire hire)		EGTT : London (FIR)	JABIRU	Reciprocating	1	UK Reportable Accident: Engine failed during approach. A/c struck hedge and overturned. Substantial damage. No injuries to two POB. AAIB AARF investigation.	CAA Closure: The aircraft suffered an engine failure during a long final approach, due to suspected carburettor icing. The proximity of an operational power station and a broken electrical lead for the electric carburettor heat were considered to be significant factors. AAIB Bulletin 11/2009, Ref: EW/G2009/03/15.
200903788	20/04/2009	Take-off	London-Gatwick - LGW		EGTT : London (FIR)	AIRBUS	Turbofan	2	Fuel Filter' messages activated. Three rejected take-offs. Filters found to be clogged.	Take-off rejected due to Generator 2 dropping off line with associated messages. Following flight crew reset, a second take-off was attempted, which was also rejected at lowpower with several messages appearing including 'Filter Clog'. When engineers arrived, no status failures messages displayed. Aircraft despatched but the third take-off was then rejected with 'Filter' and other unconfirmed messagesdisplayed. Passengers were disembarked and the aircraft taken for high power runs. 'Fuel Filter Clog' messages displayed at high power settings. Both engine fuel filters replaced and the strainers were cleaned. "Build debris" and fibres found in both strainers and both filters, which weredespatched for analysis. The aircraft then returned to service. Operator carried out MEDA investigation with recommendations made from the review referencing maintenance procedures. A QIB will be produced to highlight the hazard oftank work and the need for thorough cleaning.☐ CAA Closure: Analysis of the debris confirmed large quantities of fibrous matter assumed to be debris from scotch brite pads. It was concluded that this debris was a direct result of the work undertaken by maintenance, and that proper cleaning of the areas had not taken place. A Quality Information Bulletin 157-09 has been issued highlighting the above.
200904046	27/04/2009	Approach	Coventry		EGTT : London (FIR)	DIAMOND	Reciprocating	2	LH engine fire warning on approach. PAN declared, appropriate drill actioned and engine shut down/propeller feathered with no visible signs of fire. Hot gas leak or fire sensor fault suspected.	Aircraft had just transited an area of heavy rain, and asthrottle was retarded during engine shut down, fire warning temporarily extinguished, which reporter suspects indicates a hot gas leak. Reporter confirms that fire sensor terminal arcing is a known problem possibly caused by moisture contamination due to loose fitting rubber 'boots'. No evidence of fire/excessive heat and no fault found during extensive engineering investigation. Transient/spurious warning suspected. Total aircraft/engine/component hours since last inspection 80.50. Manufacturer advised.
200904308	30/04/2009	En route			EGTT : London (FIR)	EUROCOPTER	Turboshaft	2	Nr1 engine chip warning illuminated during the cruise. Engine shut down until finals. Aircraft landed safely with emergency services in attendance.	Fault traced to nr1 engine mag plug. Plug replaced and aircraft returned to service.
200904459	03/05/2009	Take-off	Manchester (MCT)		EGTT : London (FIR)	AIRBUS	Turbofan	2	Birdstrike to nr1 engine during take-off causing engine vibration during initial climb. Engine shutdown, MAYDAY declared and aircraft diverted.	Loud noise heard on gear retraction, with a gear problem initially suspected. Nr1 engine vibration then observed tobe 10 units. Power reduced and the vibration stopped. QRHactioned and diversion initiated. Oil quantity noted to be falling and the engine was shut down at 4qts. Single engine landing carried out. Subsequent examination revealed substantial damage to nr1 engine compressor blades.☐ CAA Closure: Damaged engine parts replaced/repared as necessary.
200904664	13/05/2009	En route	Isle of Man (IOM)		EGTT : London (FIR)	PIPER	Reciprocating	2	Engine failure. Aircraft returned. Landed safely. 1 POB, no injuries. Major engine damage. Engine cylinder separated. Cowl split. AAIB AARF investigation.	CAA Closure: During the initial climb after take-off the right engine lost power at FL60. The pilot shut down the right engine and carried out an uneventful landing. The right engine failure was caused by separation of the nr2 engine cylinder, but the cause of the cylinder separation could not be determined. AAIB Bulletin 12/2009, Ref: EW/G2009/05/07.
200905058	24/05/2009	En route	Stourton Caundle (Dorset)	Dorset	EGTT : London (FIR)	CASA	Reciprocating	1	UK Reportable Accident: MAYDAY declared due to engine failure. A/c struck telephone lines during forced landing. One fatality and one serious injury. AAIB Field investigation.	CAA Closure: The aircraft struck telegraph cables during an attempted forced landing following an engine failure. On striking the cables, the aircraft pitched nose-down, struck the ground nose first and pitched over inverted. The pilot was fatally injured and the passenger suffered serious injuries. AAIB Bulletin 04/2010, Ref: EW/C2009/05/09.
200905273	26/05/2009	En route	En Route		EGTT : London (FIR)	BAE	Turboprop	2	LH engine EGT at 670deg. Power reduced to obtain limits. Descended to FL180. Engine then wound down to zero torque with low EGT. QRH actioned, engine shutdown. Aircraft diverted.	During the descent at approx FL100 an engine relight was carried out successfully and an uneventful landing made. Entire flight conducted in VMC.☐ CAA Closure: The investigation concentrated on the engine symptoms and its response once altitude was lowered. The causal factor was determined to be the low temperature of the fuel (-30) at FL220. The fuel heating system has no monitoring system available to the crew, therefore no conformation as to its integrity.Full engine checks were carried out with manufacturer involvement with no abnormalities found. The fuel pressure regulator assembly which houses the control apparatus for the fuel heating system was replaced and adequate flight testing was carried out. No further occurrences reported.
200905572	04/06/2009	En route	London-Gatwick - LGW		EGTT : London (FIR)	BOEING	Turbofan	2	Serious Incident: MAYDAY declared due to smoke inside a/cand nr1 engine shutdown. Oxygen masks donned by crew. A/cdiverted and landed safely. Subject to Icelandic Authority investigation.	CAA Closure: This occurrence is subject to investigation by the Icelandic authorities. On receipt of their report, the CAA's records will be updated accordingly and the occurrence may be re-opened if further action is deemed necessary.
200905602	05/06/2009	En route	North Sea		EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	2	Nr2 engine chip warning illuminated in cruise. Engine shutdown law checklist. PAN declared. A/c continued to destination and carried out an uneventful run-on landing.	
200905620	07/06/2009	En route	En Route		EGTT : London (FIR)	DE HAVILLAND	Turboprop	2	Nr2 engine shut down due to low oil pressure intermittentwarning. QRH actions completed. PAN declared and a/c diverted.	Flight continued until oil pressure was constantly below 55psi and warning light continuous. Engine continued to leak oil after landing. A/c grounded for investigation.☐ CAAClosure: The operator were unaware of the high oil consumption from the contracted Part-145 maintenance organisation. As a result, the oil cooler was replaced. Oil consumption monitoring and alert procedures improved.

200905935	14/06/2009	En route	Overhead Bullington Cross (Hampshire)	1.5nm E	EGTT : London (FIR)	ROTORWAY	Reciprocating	1	UK Reportable Accident: Helicopter crashed in field. Substantial damage. No injury to one POB. AAIB AARF investigation.	CAA Closure: The helicopter was in flight when the engine stopped suddenly and without any warning. During the subsequent forced landing onto soft ground, the helicopter pitched forward, the main rotor blades struck the surface and it rolled on to its right side. It was established that the cast aluminium gear which drives the camshaft within the engine was of poor manufactured quality, resulting in the failure of several gear teeth. This led to the de-synchronisation of the camshaft with the crankshaft, allowing the connecting rods to hit the camshaft, breaking it into four sections. AAIB Bulletin 03/2010, Ref: EW/G2009/06/07.
200905971	13/06/2009	En route	Scillies		EGTT : London (FIR)	BOLKOW	Turboshaft	2	Nr2 engine chip detector illuminated during cruise. Engine shutdown and PAN declared. Uneventful run-on landing carried out. Single fine ferrous silver found on lower detector.	
200906526	23/06/2009	Approach	Enstone	0.5nm W	EGTT : London (FIR)	OTHER	Reciprocating	1	UK Reportable Accident: Engine faltered during circuit to land and aircraft forced landed in field. Damage to NLG. No injuries to one POB. AAIB AARF investigation.	CAA Closure: During the first operation following routine engine maintenance, the pilot flew a number of touch-and-go circuits, before conducting a local flight in the vicinity of the airfield. On his return, he completed a standard overhead join and commenced his descent to circuit height on the dead side of the runway. Half-way through the descent, the pilot applied power to warm the engine. On reaching the required height of 600ft he levelled out, but noted the engine was slow to accelerate again. As there was other traffic in the circuit the pilot elected to continue, but on base leg the engine started to fade and then stopped. The landing site options were limited, so the pilot chose the field with the least dense crop cover. He manoeuvred into the flare as slowly as possible, but the vegetation caused the trike to pitch forward onto the nose gear, bending it at a welded joint. The aircraft came to rest without injury to the pilot. No causal defects were identified during repair of the aircraft. The pilot reported that the atmospheric conditions were conducive to carburettor icing, but added that this engine and installation were not particularly prone to the problem. AAIB Bulletin 11/2009, Ref: EW/G2009/06/20.
200906535	28/06/2009	En route	English Channel (English Chann		EGTT : London (FIR)	PIPER	Reciprocating	1	UK Reportable Accident: Emergency declared due to engine failure. A/c ditched in sea nine miles off Lydd and sank. Minor injury to one POB. AAIB AARF investigation.	CAA Closure: The pilot reported that the aircraft was refuelled to full tanks before departure from Lydd. Having levelled at 2000ft, and seven miles from Lydd, he switched the fuel pump on and changed the fuel selector from the LH to RH tank. Ten or fifteen seconds later, the manifold pressure dropped and the RPM decayed. The pilot immediately selected the mixture to fully rich and re-selected the left tank. The engine continued to run, but at low power and with sounds of mis-firing. The pilot selected the alternate air source, but the engine did not recover and then stopped. He made a mayday call and selected 7700 on his transponder whilst making several unsuccessful attempts to re-start the engine. The pilot flew towards a ship, opened the cabin door, selected the landing gear manual override and prepared to ditch. The ditching was carried out with full flap and with the aircraft fully stalled onto the top of the five metre swell (the wind was approximately 210/9kts and the ditching was carried out on a heading of 240deg). The aircraft touched down tail first and bounced. On the subsequent impact, the fuselage briefly submerged before it floated. The pilot, uninjured, put on his lifejacket and exited the aircraft onto the wing. He waved to the ship but it continued its passage; its crew had seen the ditching and contacted another ship behind them by radio with instructions to rescue the pilot. After approximately 2mins, the aircraft pitched 45deg nose down and sank. The pilot was rescued by the second ship, transferred to a lifeboat and then airlifted to hospital by helicopter; he had been in the water for 20mins and was treated for mild hypothermia. The aircraft was not recovered and no technical investigation into the engine failure was possible. The pilot commented that he thought the engine failure might have been caused by debris in the fuel injectors, a faulty fuel selector or contaminated fuel. No other aircraft which refuelled at Lydd reported problems. He added that he intended in future to wear his lifejacket for flight over water. See AAIB Bulletin 09/2009, Ref: EW/G2008/06/21.
200906567	27/06/2009	En route	Great Oakley (Essex)		EGTT : London (FIR)	TAYLOR	Reciprocating	1	UK Reportable Accident: Aircraft reported to be in difficulties after take-off. Attempted to return to airstrip but "spun in". One POB with fatal injuries. AAIB Field investigation.	CAA Closure: The aircraft experienced a significant engine problem soon after takeoff. The pilot apparently attempted to fly an abbreviated LH circuit at low height to land back at the airfield. During this manoeuvre the aircraft stalled, with insufficient height for the pilot to recover to controlled flight. The pilot was fatally injured in the subsequent ground impact. AAIB Bulletin 07/2010, Ref: EW/C2009/06/05.
200906721	30/06/2009	Take-off	Manchester Barton A/F (Greater	Eccles	EGTT : London (FIR)	OTHER	Reciprocating	1	UK Reportable Accident: Engine failed shortly after take-off. MAYDAY declared. A/c crashed in garden & was destroyed. Wall & car damaged. Minor injuries to two POB. AAIB Field investigation.	CAA Closure: The aircraft suffered a loss of engine power shortly after take-off and crashed in a built-up area. The two occupants received minor injuries, but no one on the ground was injured. No mechanical defects were found during strip examination of the engine. There was insufficient evidence to establish the cause of the loss of power, but an interruption in the fuel supply is believed to be the most likely cause. AAIB Bulletin 06/2010, Ref: EW/G2009/06/06.
200907062	08/07/2009	En route	Bishop Norton (Lincolnshire)	Barff Farm	EGTT : London (FIR)	OTHER	Unknown		UK Reportable Accident: A/c crashed. Reports of fire. One POB, fatal injuries. Extensive a/c damage. AAIB Field investigation.	CAA Closure: While cruising at 2500ft the a/c suffered a mechanical engine failure which led to an in-flight fire. The pilot was probably rendered unconscious by the smoke and fumes from the fire; the a/c crashed into a field and the pilot was fatally injured. The engine failure was initiated by a fatigue crack of the nr6 piston gudgeon pin. The cause of the fatigue crack initiation could not be determined but it is likely that a high-load event, such as a partial or full hydraulic lock, initiated the crack in the pin. The presence of corrosion pits on the inner surface of the pin was probably a contributory factor and the a/c's low utilisation rate during the previous 45 years probably contributed to the formation of corrosion. In addition to the initial CAA safety actions, three AAIB Safety Recommendations, nrs 2010-029, 2010-030 and 2010-031 addressed to the UK Civil Aviation Authority, are made. AAIB Bulletin 10/2010, Ref: EW/C2009/07/02.
200907122	09/07/2009	En route	Norwich		EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	2	LH engine chip warning.	LH engine chip light illuminated during the climb. Power reduced to safe single engine configuration. Nr1 engine oil pressure observed to be lower than normal. PAN declared. Flight continued to scheduled destination. Nr1 engine oil pressure monitored and observed to be low, with some fluctuation. Engine shut down. Single engine approach and landing completed with no further complications. Very fine fuzz found on magnetic plug.
200907314	10/07/2009	En route	Exeter	5 NE	EGTT : London (FIR)	PIPER	Reciprocating	2	MAYDAY declared due to engine failure. A/c returned and landed safely with fire service in attendance.	Investigation found a fuel injection line attached to nr2 cylinder head had failed. The failure had occurred at a union where it forms a 3-way connection with injector pipes from other cylinders. CAA Closure: The fracture occurred at the braze joint under the union nut. The log book entry recorded that the maintenance organisation had carried out the FAA AD 2008-14-07, which called for a repeat visual inspection of the fuel lines, no evidence of fuel leak was reported. The crack was clean, suggesting that the fracture was caused by high cycle fatigue, probably from a flaw in the braze joint. The fractured lines were replaced with no further incident. The case is considered as an isolated incident.
200907418	19/07/2009	En route	Knoke Hall Farm (Essex)	Bulpham	EGTT : London (FIR)	SUPERMARIN E	Reciprocating	1	UK Reportable Accident: Propeller rpm uncontrollable and smoke from engine. Substantial damage during forced landing. Minor injury to one POB. AAIB AARF investigation.	CAA Closure: During the kit-built aircraft's first test flight, following a two year period of construction, the engine seriously overheated and failed and the RH landing gear failed to deploy for the landing. The engine failure resulted from an incorrect setting of the carburettors, resulting in a too lean fuel/air mixture whilst the landing gear failure to deploy occurred because the uplock pin could not be withdrawn, most probably due to it being a tight fit in the receptacle in the leg. This accident was investigated fully by the Light Aircraft Association (LAA) with particular emphasis on overall project management, during both the build stages and during the lead-up to the first flight as well as the conduct of the flight itself. The outcome of their investigations, and lessons drawn from it, form the basis of a case study conducted by the LAA. AAIB Bulletin 03/2010, ref: EW/G2009/07/16.
200907419	06/07/2009	En route	Bournemouth	15 NW	EGTT : London (FIR)	DIAMOND	Reciprocating	2	LH engine fire caution illuminated in cruise. Fire drill actioned, engine shutdown, emergency declared and a/c returned.	Fire caution cleared as a/c exited cloud, but returned at approx 2000ft during descent and remained on until shutdown. Subsequent inspection found no evidence of fire.
200907526	09/07/2009	En route	London-Heathrow - LHR		EGTT : London (FIR)	BOEING	Turbofan	4	Nr1 engine surge and EGT exceedance with "ENG1 Control" status message on closing thrust levers at TOD. QRH actioned. Engine shutdown. Autoland carried out.	
200907685	24/07/2009	En route	Shoreham (Kent)	Nr Orpington	EGTT : London (FIR)	OTHER	Reciprocating	1	UK Reportable Accident: Engine failure. MAYDAY declared. Struck a fence during forced landing in a field. Two POB, one serious and one minor injuries. Substantial a/c damage. AAIB Field investigation.	CAA Closure: The a/c was flying at 600ft agl when the engine suddenly stopped. The pilot chose a small field for a forced landing and landed downwind with a tailwind of 10 to 15mph. The a/c landed well into the field and the combination of a late touchdown with a high groundspeed and poor braking action on wet grass caused the a/c to run on into a substantial wooden fence. Both the pilot and his passenger were injured in the accident. AAIB Bulletin 10/2010, Ref: EW/C2009/07/05.
200907752	22/07/2009	Approach	Coventry		EGTT : London (FIR)	DIAMOND	Reciprocating	2	PAN declared due to engine fire warning. LH engine precautionary shut down. Suspected spurious warning. D & D advised. Uneventful landing with fire services in attendance.	
200907869	24/07/2009	En route	Yeovilton	5nm SE	EGTT : London (FIR)	DIAMOND	Reciprocating	2	LH engine fire warning triggered shortly after a/c entered cloud/rain. Engine shutdown and PAN declared. A/c returned and landed safely with fire service in attendance.	No signs of smoke or fire. Recurring fault.

200907871	17/07/2009	En route	ORTAC	10 S	EGTT : London (FIR)	DIAMOND	Reciprocating	2	LH engine fire caption illuminated in flight. Engine shutdown and a/c diverted. No signs of smoke or fire.	Similar symptoms had been reported 11 days earlier, recurred later on the same day and again seven days later. On all four occasions the warning triggered after the a/c had entered cloud/rain.
200908061	31/07/2009	En route	En Route		EGTT : London (FIR)	SIKORSKY	Turboshaft	2	Nr2 engine oil pressure above the maximum permitted. Aircraft returned for further investigation.	
200908351	08/08/2009	En route	Coltishall		EGTT : London (FIR)	JODEL	Reciprocating	1	Engine power loss. Forced landing. Suspected carburettor icing.	Engine power loss and engine speed reduced at approximately 3000ft during descent. Carburettor heat confirmed as 'On'. Brief engine response before further power loss. Further restart attempts abandoned in favour of maintaining gliding range and positioning for a forced landing. Aircraft landed safely on disused runway with no damage. No engine faults found. The reporter considers that with relative humidity near to 90% at 4000ft and temperature +10deg C, theconditions were well within the carburettor icing envelope.
200908405	09/08/2009	En route	Kidderminster (Hereford and Wo	West Midlands Safari Park	EGTT : London (FIR)	OTHER	Reciprocating	1	UK Reportable Accident: Engine failure. Forced landing. Two POB, no injuries. Substantial damage during the landing. AAIB AARF investigation.	CAA Closure: Shortly after taking off, the engine stopped. After turning back, the pilot selected a field in which to make a forced landing. However, the field sloped downwards, and the pilot was unable to land, before being forcedto make a turn to avoid a railway embankment. During the turn, the aircraft's wingtip and landing gear contacted the ground and the aircraft was damaged. No positive reason for the engine failure was a established by the pilot, although vapour locking or carburettor icing were possible factors. AAIB Bulletin 12/2009, Ref: EW/G2009/08/10.
200908893	20/08/2009	En route	Lippitts Hill		EGTT : London (FIR)	MBB	Turboshaft	2	Eng PA Disc' (Engine Parameter Discrepancy) warning on both engines. Aircraft returned.	During cruise, nr1 engine first level indicator (FLI) needle momentarily fell to zero before returning to match nr2FLI (with nr1 engine operating normally throughout). Shortly afterwards, both 'Eng PA Disc' warnings illuminated. Investigation showed torque and N1 parameters were displaying normal values but in yellow. FRC actions undertaken andaircraft returned to main operating base for an uneventful landing.□ CAA Closure: The event was considered to be a software glitch which was supported by the aircraft manufacturer. In their opinion, it was triggered by the drop of the needle on the first level indicator, which in return is supplied by the engine torque, N1 and TOT sensors.
200909756	07/09/2009	En route	London-Heathrow - LHR		EGTT : London (FIR)	AIRBUS	Turbofan	2	Nr2 engine shutdown following total oil loss. PAN declared and ECAM drills actioned. Full emergency declared.	Oil leak traced to transfer gearbox supply pipe end fitting.
200909813	10/09/2009	Take-off	Southampton (SAM)		EGTT : London (FIR)	DE HAVILLAND	Turboprop	2	Double bleed hot caution at 500ft agl during initial climb. Emergency checklist actioned - aircraft unable to be pressurised and returned.	Aircraft had not yet reached acceleration altitude therefore bleeds had not yet been switched on. Aircraft 'event marker' was pressed, checklist items completed and Tech Logentry made.
200909920	13/09/2009	Approach	Sherburn in Elmet		EGTT : London (FIR)	PIPER	Reciprocating	1	Engine stopped at approximately 1800ft during practice forced landing. MAYDAY declared and a/c squawked 7700. Successful emergency landing completed in a cropped stubble field.	
200910318	22/09/2009	En route	Cranfield (CIT)		EGTT : London (FIR)	DIAMOND	Reciprocating	2	Engine failed to restart in flight.	LH engine deliberately shut down during an engineering test flight. On attempted restart, the propeller failed to unfeather and the engine failed to start. Electric starter used as per checklist without success. Several further unsuccessful attempts made at higher speeds. PAN declared prior to landing without further incident. The reporter notesthat the aircraft had recently returned from maintenance where new engines had been fitted. Engineering investigation found that both engines would not auto-unfeather. Both unfeathering accumulators were serviced and proved satisfactory on ground runs.
200910532	18/09/2009	En route	Birmingham	Chase	EGTT : London (FIR)	CESSNA	Reciprocating	2	PAN declared. Aircraft RH engine had been shut down. Pilot offered a new destination but elected to return to primary airport. D&D and ATC advised.	
200910555	29/09/2009	En route	En Route		EGTT : London (FIR)	MBB	Turboshaft	2	LH engine chip caption illuminated in flight. Fuzz burneractivated but warning persisted. Emergency checklist usedand engine shutdown.	
200910629	22/09/2009	En route	Attleborough (Norfolk)	2nm S	EGTT : London (FIR)	BOLKOW	Turboshaft	2	Nr1 engine in-flight shut down due to a chip warning. Flight continued to base. Chip plug contaminated.	Nr1 engine lower chip plug contaminated with fine sliversand fuzz. All three modules (compressor, accessory gearbox and turbine) replaced. Unserviceable modules sent to repair facility.
200910774	09/08/2009	En route	Coventry		EGTT : London (FIR)	CESSNA	Reciprocating	2	LH engine shutdown due to smoke from the exhaust. Aircraft returned. Emergency services deployed. Aircraft landed safely.	
200910824	04/10/2009	En route			EGTT : London (FIR)	CESSNA	Reciprocating	1	MAYDAY declared due to engine failure. Aircraft squawked 7700. Forced landing in a field. Landed safely.	
200911143	13/10/2009	Take-off	Liverpool		EGTT : London (FIR)	AIRBUS	Turbofan	2	Multiple birds struck a/c during t/o roll at 120kts resulting in nose swing to the right followed by surge of RH engine. High speed RTO performed. Fire services attended. RHengine shut down.	On inspection, three birds found to have struck nose, nose wheel, right wing and RH engine.
200911162	13/10/2009	Take-off	Blackpool (BPL)		EGTT : London (FIR)	CESSNA	Reciprocating	2	Severe RH engine vibration together with yaw to the rightshortly after take-off. Engine shutdown. PAN declared. Fuel burnt off, a/c returned.	CAA Closure: The investigation revealed a catastrophic failure of nr5 cylinder connecting rod. Engine replaced withoverhauled unit.
200911238	15/10/2009	Approach	Southampton (SAM)		EGTT : London (FIR)	DE HAVILLAND	Turboprop	2	Nr2 engine FADEC failure and aircraft swings to right andleft. PAN declared.	During flight a swing to the right was experienced and atthe same time 'Nr2 Eng FADEC Fail' warning caption, 'Nr2 Oil press' and 'Nr2 DC gen' captions illuminated. This wasfollowed by a further swing to the left. Nr2 engine FADECfailure vital checklist actions completed followed by engine shut down drills. During shut down Alt Feather button was required to feather engine. PAN declared and aircraft given direct routing to destination.
200911248	15/10/2009	Take-off	London-Heathrow - LHR		EGTT : London (FIR)	AIRBUS	Turbofan	2	When setting t/o power, crew heard a bang. Nr1 engine stalled during t/o roll. Aircraft slewed to left and smell ofburning. Nr1 engine shutdown. No associated ECAM warningsor cautions received.	CAA Closure: The event is attributed to HPC stage 3 rotorblade nr5 fractured at the blade root. This is a known problem due to clapper wear and is corrected by installing modified blades. In compliance with routine boroscopes, no significant wear had previously been detected.
200911360	15/10/2009	Approach	Cambridge		EGTT : London (FIR)	DIAMOND	Reciprocating	2	Uncommanded RH engine shut down with LH engine in simulated feather mode during test flight. LH engine brought backon line. Emergency declared. Uneventful landing with fireservices in attendance.	Various fault codes generated - ECU/propeller valve faultsuspected. Total aircraft/component hours since overhaul/inspection 3. Engine manufacturer advised.□ CAA Closure: Right Hand ECU contaminated with water, due to water leaking through the engine cowlng into the 'dry bay' area wherethe ECU is located. The manufacturing defect occurred during aircraft manufacture, late 2005 and early 2006. Since delivery to the current owner in August 2006, the aircrafthas required eight ECU's to remain serviceable as a result of this defect, which only occurs after a period of heavy rain. The aircraft had been previously modified in accordance with Mandatory Service Bulletin MSB-42-028 issued 2 Oct. 2006 "The sealant of the engine control harness may be broken, which due to heavy rain, water can enter the harness and accumulate within the ECU". As a result the ECU has been replaced and the 'open rivet' has been sealed in accordance with approved data.
200911505	23/10/2009	En route	London-Gatwick - LGW		EGTT : London (FIR)	BOEING	Turbofan	2	RH engine in-flight shut down due to oil system loss withassociated contents and pressure warnings. ORH actioned. PAN declared. Diversion. Overweight landing at 90700kg.	

200911881	03/11/2009	En route	Manchester (MCT)		EGTT : London (FIR)	BOEING	Turbofan	2	LH engine fire warning during the climb. MAYDAY declared.Engine shut down. Diverted. Safe overweight landing.	CAA Closure: The a/c had been dispatched with the left engine nr2 fire loop inoperative, in accordance with MEL 26-11-1, with a deferral period of ten days and non-ETPOS. The fire master warning illuminated several times within a 60sec period following attainment of FL203 and the left engine was shut down. The aircraft diverted. As there was no indication of fire damage, the engineering investigation centred on the nr1 and nr2 fire loops. No defects could be found with the nr1 fire loop. Inspection of the nr2 fire loop, the MEL entry, identified a chafe on detector 3, which was subsequently replaced and functionally checked satisfactorily. The engine was ground run and there has been no further recurrence of the fault. With the investigation having identified the fault in the nr2 fire loop, it was unable to find a physical fault, or recreate the fault, on the nr1 system as seen on the Flight Data. It is this subsequent fault within the nr1 system, combined with the extant fault in the nr2 system that was responsible for the left engine fire warning. It is probable that the fault within the nr1 fire loop was with the connections in the system and it is likely that the act of removal for testing rectified the fault. The nr2 fire loop system was replaced. The nr1 fire loop system was cleaned and tested and the engine ground run satisfactorily.
200911913	04/11/2009	En route	London-Heathrow - LHR		EGTT : London (FIR)	AIRBUS	Turbofan	2	Nr1 engine in-flight shutdown due to oil loss.	Nr1 engine oil quantity warning during the climb. Rate of loss approximately 0.5 quarts per 3secs. Engine shutdown.Shortly afterwards, quantity displayed zero. PAN declared and the aircraft returned.☐ CAA Closure: Engineering confirmed a fractured scavenge return pipe from the nr4 bearing. Engine replaced. Investigation confirms that the fracture was the result of an incomplete weld. There is no indication of a batch problem and considered a random occurrence.
200912175	04/11/2009	En route	Blackpool (BPL)		EGTT : London (FIR)	SIKORSKY	Turboshaft	2	RH engine in-flight shut down due to illumination of chip warning light. Diversion. Full emergency declared by ATC.	
200912184	10/11/2009	En route	En Route		EGTT : London (FIR)	DASSAULT	Turbofan	2	During flight a dull thud was felt and heard through airframe. RH engine smoothly wound down. PAN declared.	During descent engine shutdown law with checklist. A windmill relight was attempted, and the subsequent start was normal. Engine set at 85% and left until 3000ft when 1.2EPR was set. Approach and landing were uneventful.
200912190	11/11/2009	En route	Bournemouth		EGTT : London (FIR)	DASSAULT	Turbofan	2	During the initial climb, nr1 engine oil pressure fluctuated before slowly decreasing and low oil temperature noted. CWP 'Oil P' caption then activated.	Throttle retarded to idle and engine shut down using ECL.MAYDAY declared and, after burning off fuel to reach maximum landing weight, the aircraft returned.
200912283	13/11/2009	Take-off	Norwich		EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	2	MAYDAY declared due to nr1 engine fire caption after Take-Off Decision Point (TDP). Aircraft landed in field. Nr1 engine shut down, fire caption extinguished - no fire confirmed.	RFS deployed but not required. Engine fire detection system checked by engineer and appeared to be functioning normally - spurious fire warning suspected, possibly due to inclement weather conditions, which is a known problem on type. Subsequent investigation of pilot report that nr1 engine turbine outlet temperature was 60deg C higher than nr2 engine revealed a crack in the armpit of outer combustion case, which reporter considers would most probably have contributed to initial engine fire caption, as hot exhaust gasses would have impinged on upper fire detector. Reporter confirms that cracking in this area is a common fault.
200912320	16/11/2009	Approach	Norwich		EGTT : London (FIR)	SIKORSKY	Turboshaft	2	Engine fire indication on approach.	On a preceding flight, the generator failed while flying through heavy rain. EOP carried out and the generator reset on the first attempt. On the subject flight, nr1 engine fire warning activated on short finals. Fire drill carried out, both bottles discharged but the warning remained. MAYDAY declared and a single engine landing carried out. Full emergency declared. Following landing, it was decided that the warnings were spurious. Water ingress to both engine fire amplifiers suspected.☐ CAA Closure: Investigation confirmed water ingress in both engine fire amplifiers and the AC electrical controller. These components are located in the electrical bay, which should be kept dry. However, experience with this helicopter type shows that deterioration of the engine deck sealing, and loosening of engine deck drain lines can result in leakage into the electrical bay beneath. Engine fire amplifiers and AC controller were removed, cleaned, re-sealed and re-installed. Fire bottle and cartridges replaced. Engine deck drain lines and sealing checked and rectified. Aircraft returned to service.
200912445	16/11/2009	En route	Birmingham		EGTT : London (FIR)	BAE	Turboprop	2	Engine flameout followed by successful reignition.	While descending through cloud, heavy rain and in moderate icing, all anti-icing was on plus continuous ignition. The RH engine flamed out causing the aircraft to yaw and roll to the right. A similar event then appeared to occur to the LH engine before it reignited, flamed out and reignited again. By this time the RH engine had reignited and power was increasing to normal parameters. Normal flight then followed. It was suspected that flameout or partial flameout was caused by heavy rain/ice injection. Subsequent investigation indicated that nr2 engine reduced to 63.4% for less than three seconds before spooling back to the normal range. Nr1 engine remained at 97% throughout so no flameout actually occurred. FDR data has been sent to the manufacturer for analysis.☐ CAA Closure: The event was caused by the heavy rain. No further action required.
200913266	14/12/2009	En route	Tarporley (Cheshire)	Nr Beeston Castle	EGTT : London (FIR)	OTHER	Reciprocating	1	UK Reportable Accident: Engine failure in flight. Forced landing in a field, clipping a tree on approach. One POB, minor injuries. Aircraft destroyed. AAIB AARF investigation.	CAA Closure: At a height of approximately 700ft above ground level, the engine stopped for a second time during the flight. The pilot carried out a forced landing but as the aircraft approached the selected field, it clipped the top of a row of trees, causing the aircraft to pitch over and crash-land before coming to rest inverted just beyond the trees. The aircraft was extensively damaged but, due to his harness and local strengthening of the aircraft's structure, the pilot sustained only minor injuries. The weather at the time of the flight was such that there was a serious risk of carburettor icing at any power setting. AAIB Bulletin 04/2010, Ref: EW/G2009/12/11.
200913844	09/09/2009	En route			EGTT : London (FIR)	AIRBUS	Turbofan	2	Thrust reverser deployment warning and loss of lock redundancy in flight. Alleged suspect maintenance practice.	Nr2 engine vibrated and thrust reduced at FL100 during the climb. Engine shutdown by crew and the aircraft returned to departure airport. Inspection found ball bearings from feedback actuator TY1541 to have migrated, which affected the operation of a locking actuator within the thrust reverser system, thereby preventing stowing and locking of the reverser. Disassembly found a ball bearing assembly had been incorrectly installed and a wormshaft was missing from the feedback actuator. Investigations suggest the possibility of incorrect or inappropriate maintenance activity contributed to the incident.
201000004	02/01/2010	En route	Stansted		EGTT : London (FIR)	BAE	Turbofan	4	Loud bang heard and a slight vibration and yaw noted. Nr2 engine failure. N1 and TGT indications observed to be erratic.	QRH actions carried out. PAN declared. A/c returned. Investigation found damage to first LP compressor vane assembly. Engine strip down revealed extensive damage to the engine core. No compressor blades were standing, with damage through to the 4th turbine. It is suspected the initial malfunction was a fracture through the root lobe of one or more 1st stage high pressure compressor blades. Evidence found of fatigue 'beach marks' on the roots of several blades which had released from the 1st stage disc. Due to secondary damage, crack initiation could not be identified although there was heavy fretting damage on the 1st stage bladeroots. The released blades caused cascading damage to the remaining 1st stage blades and to downstream blades and stator assemblies. Compressor damage caused a significant reduction in air flow to the high pressure turbine and nozzle guide vane cooling channels which caused the 1st and 2nd stage turbine blades and 2nd nozzle vanes to melt.☐ CAA Closure: The strip down investigation determined that a 1st stage compressor blade had failed. The damage can only be detected in a strip-down, boroscopying not being sufficient as the crack initiation in the root can only be detected with the blade removed from the disk. The OEM has agreed to add information to the existing ALF/LF-72-1105 Service Bulletin, to protect against blade root cracking
201000132	07/01/2010	Take-off	Thruxton		EGTT : London (FIR)	BOLKOW	Turboshaft	2	Failure of nr2 engine during start-up.	Start up was initiated on external power. Nr1 engine started without incident. Nr2 engine started and was a slightly hotter start but was controlled by the ECL. Both engines established, the external power source disconnected. Main battery and generators selected on. Additional crew member entered the aircraft and remarked that a brief flame from the nr2 exhaust had been seen. This was thought to have occurred at the same time the generators were selected. Both engines shutdown. Subsequent discussions also revealed that a small puff of smoke had also been seen. Visual examination of the intake did not reveal any signs of FOD. Compressor assembly would not rotate by hand. Generator removed and free to turn, and St/Gen drive could be turned by hand. Engine rejected for investigation.
201000256	13/01/2010	En route	Exeter		EGTT : London (FIR)	BAE	Turboprop	2	RH engine in-flight shut down due to loss of torque. Emergency checklist actioned. MAYDAY declared. Precautionary descent from FL230 to FL140. Diversion. Uneventful single engine landing carried out.	CAA Closure: During investigations, engine ground runs and power assurance checks were carried out but the fault could not be reproduced. Fuel management checks and engine control checks also revealed no faults. Further diagnosis suspected that ice within the fuel heating system could have produced this fault as the prevailing flight conditions at the time could have created 'icing' conditions. The fuel pressure regulator and the fuel heating control mechanism was replaced in its entirety. A failure of the fuel heating system would not alert the crew of a potential unsafe condition and the component changes were deemed a practical response to such a condition. A non revenue flight was carried out to check the system with no further faults found.
201000544	23/01/2010	En route	Humberside	10nm NE	EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	2	PAN declared due to nr1 engine chip warning. Engine shut down law checklist and aircraft returned.	

201000874	01/02/2010	En route	Cranfield (CIT)		EGTT : London (FIR)	DIAMOND	Reciprocating	2	During a multi-engine familiarisation flight in which theLH engine was deliberately shut down, the propeller failed to unfeather and the engine failed to restart.	Restart attempted using electric starter as per the checklist without success. PAN declared, full emergency declared and the a/c returned to base. □ CAA Closure: The operatorunderwent a maintenance programme to modify their DA42 a/c with 2.0 litre engines in accordance with Service Bulletin OSB-42-046/1 which included replacement of the unfeathering accumulators. The accumulators were not charged with nitrogen nor filled with oil during the works and were installed without verifying that they were charged. A function test of the accumulator was not performed post engine upgrade when the engine tests were performed. The operator has issued an Urgent Engineering Notice to all personnel detailing the event and the importance of following maintenance practices.
201001213	12/02/2010	En route	Warrington (Cheshire)	Overhead	EGTT : London (FIR)	BRITTEN NORMAN	Reciprocating	2	LH engine in-flight fuel leak. Aircraft returned and LH engine shut down. Uneventful single engine landing with fire services in attendance. Fuel bowl detached resulting in loss of 100 litres of fuel.	First instance of fuel bowl detachment known to maintenance organisation. Fuel bowl refitted law maintenance manualwith wire attachment clips that had detached and aircraftreturned to service following a test flight. Aircraft manufacturer advised and asked about any necessity for additional locking on locating clips. Total aircraft hours 4687.40.
201001809	02/03/2010	En route	Cranfield (CIT)		EGTT : London (FIR)	DIAMOND	Reciprocating	2	LH engine shut down during training exercise. Failed to restart. PAN declared and the aircraft returned to base. Emergency services deployed. Landed safely.	
201001820	03/03/2010	En route	Penryheol (Glamorgan)	Pencefnarda Farm	EGTT : London (FIR)	CESSNA	Reciprocating	1	UK Reportable Accident: MAYDAY declared due to engine failure. Emergency landing. A/c inverted in field. Two POB, one no injury, one minor injuries. AAIB AARF investigation.	CAA Closure: The accident occurred while the a/c was engaged on an instructional flight. As it neared its destination, the a/c experienced a loss of power and a forced landing was made in a field. When the nosewheel dug into the soft ground on landing, the a/c tipped forward and inverted.The instructor, who was not wearing his full safety harness, sustained facial injuries. AAIB Bulletin 08/2010, Ref:EW/G2010/03/01.
201001946	02/03/2010	En route	Pitsford		EGTT : London (FIR)	CESSNA	Reciprocating	1	Engine power loss during the cruise. PAN declared. The engine then stopped. Safe forced landing on private airstrip.	By priming the engine, some RPM was restored for a few seconds. A PAN call was made to ATC who acknowledged a possible forced landing at Pitsford. The propeller stopped turning on the downwind leg. Initial investigation found internal damage to one cylinder.
201002168	02/03/2010	Approach	Fenland		EGTT : London (FIR)	CEA	Reciprocating	1	On approach, a/c "banged and rattled" followed by smoke in the cockpit. Engine shut down and a/c glided in. Landed safely. Two POB, no injuries. Large hole found in the bottom of the engine.	
201002310	16/03/2010	Take-off	London-Heathrow - LHR		EGTT : London (FIR)	BOEING	Turbofan	4	Birdstrike to nr3 engine at 600ft during climb out. EGT over limit, other engine parameters abnormal. Severe damageQRH actioned, engine shut down. A/c returned. Fan blades bent, cold stream damaged.	
201002368	15/03/2010	Approach	London-Heathrow - LHR		EGTT : London (FIR)	BOEING	Turbofan	4	Nr1 engine run down on final approach. Investigation found metal debris contamination in HP fuel filter.	Incident investigation to be progressed.
201002415	19/03/2010	En route	Overhead Douglas	West Baldwin (Isle of Man)	EGTT : London (FIR)	ENSTROM	Reciprocating	1	UK Reportable Accident: Engine stopped at 200ft in the climb. Entered autorotation. Emergency landing in a field. Substantial damage. One POB, no injuries. AAIB AARF investigation.	CAA Closure: The helicopter took off from a private landing site. At a height of 200 to 300ft agl the pilot perceived that the engine had stopped and immediately entered autorotation. He turned towards a field on his left, flared, to reduce speed and level off, and the helicopter dropped to the ground from a height of about 10 to 12ft. The damage was substantial but the helicopter remained upright and the pilot escaped uninjured. No conclusive evidence was found to explain the loss of power. AAIB Bulletin 09/2010, Ref: EW/G2010/03/10.
201002646	26/03/2010	En route	Bournemouth	15nm NE	EGTT : London (FIR)	PIPER	Reciprocating	2	Aircraft reported a rough running RH engine. ATC provideda direct track clearance. During later stages of approach, pilot reported shutting down RH engine due to oil leak. Aircraft landed safely.	
201002714	25/03/2010	En route	Lyneham	15nm SSE	EGTT : London (FIR)	DIAMOND	Reciprocating	2	LH engine fire warning shortly after flight through moderate rain. Precautionary engine shut down. Emergency declared. Aircraft returned. No visible signs of fire. False warning suspected.	Spurious warning suspected due to water ingress. Post flight inspection confirmed no sign of fire. Engine allowed to dry out and subsequent functional check satisfactorily carried out law maintenance manual. Aircraft manufacturer RSB42-072/1, which introduces application of improved moisture sealant on fire sensor to prevent inadvertent warnings, will be carried out during next scheduled maintenance.
201002840	05/04/2010	En route	Luton (LUT)		EGTT : London (FIR)	BEECH	Turbofan	2	Flight crew advised their intention to shut down nr1 engine. PAN declared and aircraft diverted.	
201002951	02/04/2010	Take-off	Bristol International		EGTT : London (FIR)	CESSNA	Turbofan	2	LH engine fuel leak.	Following a period of flight idle settings on the LH engine during simulated asymmetric training, the engine failed to respond to throttle input. An unsuccessful attempt to restart the engine was made. Engine shutdown procedure carried out and the a/c returned to base. Inspection revealed a fuel leak from the LH engine cowling due to a rigid fuel line having cracked around the weld seam at the flange end to the oil cooler. A replacement fuel line was fitted and the a/c returned to service. After a two hours of operation, the same fault recurred. The reporter notes the engine and a/c manufacturers have both issued Service Bulletins addressing this issue due to suspect weld joints but the effective serial number range of the Bulletins do not include the subject engine. The a/c manufacturer has been advised of the failure and the engine is with the UK representative for the manufacturer. □ CAA Closure:□ Maintenance staff carried out a ground run which identified a high frequency vibration of the starter generator. The starter generator was changed and subsequently refitted to the repaired engine, where no other related incidents have occurred. This has been subject to in service action and the high frequency vibration of the starter generator and the major root cause was not evident to the operating crews. This occurrence was reviewed by the Continued Airworthiness Review Team and categorised as 'no further investigation'. Additionally, EASA has been notified and advised us that they have informed the primary certificating authority. No further occurrences of this nature found for the aircraft type.
201003049	08/04/2010	En route	Manchester (MCT)		EGTT : London (FIR)	PIPER	Reciprocating	2	LH engine rapidly lost power and stopped during the cruise. PAN declared. A/c diverted.	CAA Closure: Investigation found the propeller governor to have failed due to excessively worn / stripped teeth on the male end (engine connection) of the governor's splineddrive shaft. On removal, the governor was free to rotate with no indication of any abnormal resistance. Unit despatched to the manufacturer for a strip down and report. Engine also changed as a precautionary measure also subject toa full strip report. Operator considering alternative drive shaft provisions.
201003156	10/04/2010	En route	Newton Abbot (Devon)		EGTT : London (FIR)	AVID	Reciprocating	1	UK Reportable Accident: A/c suffered engine failure, impacting a hedge on landing. One POB, serious injuries. A/c destroyed. AAIB Field investigation.	CAA Closure: While cruising at approximately 1900ft, the pilot noticed the engine coolant temperature rising rapidly. He reduced the engine rpm from 5100 to 4000rpm but about 15secs later, the engine stopped suddenly without being preceded by any rough running. The pilot attempted to carry out a forced landing into a field but stalled the a/c ata height of about 20ft just short of the field. An examination revealed that the engine had seized in flight due tooverheating. The overheating was probably caused by a loss of radiator coolant. AAIB Bulletin 02/2011, Ref: EW/C2010/04/05.
201003179	12/04/2010	En route	En Route		EGTT : London (FIR)	BAE	Turbofan	4	Uncommanded nr1 engine shutdown in flight. ECL actioned. PAN declared. Aircraft returned.	On reaching FL190 and 280kts, nr1 engine shutdown and engine overspeed illuminated. Crew secured the engine as per the emergency/abnormal checklist. PAN declared. Aircraft returned where an uneventful landing was carried out. Investigations found a defective secondary overspeed controller.

201003258	10/04/2010	En route	Caernarfon (Gwynedd)		EGTT : London (FIR)	OTHER	Reciprocating	1	UK Reportable Accident: Engine misfired and stopped during climb out. Forced landing in a field. Encountered small ditch. A/c came to rest on its side. One POB, minor injury. AAIB AARF investigation.	Extensive a/c damage. CAA Closure: The accident flight occurred on the first flight of the day. The a/c engine and pre-takeoff checks were satisfactory and the a/c was taxied out. The engine temperatures and pressures were reported as normal during the rolling takeoff and the engine power was reduced from 5300rpm to 4800rpm after becoming airborne to reduce the pitch attitude. At approximately 200ft in the climb the engine 'coughed' twice and then stopped. The pilot turned to the left as there were no landing options ahead of the a/c and declared a MAYDAY. He considered that all of his landing options were poor but he touched down successfully on a small grassed area adjacent to the airfield. However, during the landing roll, the a/c ran across a drainage ditch and sustained damage to the front end pod, nose wheel and a/c structure. The pilot had become aware of debris in the fuel tank shortly after acquiring the a/c earlier in the year. However, he had been advised that the fuel filter would catch any debris until such time that a suitable opportunity for cleaning the system arose. The a/c had been successfully flown on the day prior to the accident. Subsequent to the accident, debris was also found in the main fuel filter and in the fuel line before the filter. The source of the debris was not identified but reported as a build up rather than solid debris. Other than the presence of debris in the fuel system, the pilot identified other factors associated with the accident. The use of a rolling takeoff and a reduction in power after becoming airborne resulted in the a/c being at a lower altitude over the airport boundary which reduced the forced landing options. The pilot noted that, for a take-off from this subject runway, the number of reasonable options for a forced landing from low altitude was very limited. AAIB Bulletin 08/2010, Ref: EW/G2010/04/10.
201003298	13/04/2010	Manoeuvring	Mountain flying training area		EGTT : London (FIR)	BELL	Turboshaft	2	Mast torque oscillations between 65 - 85% and engine torques oscillated together during high hover over mountain landing site. Oscillations ceased when power reduced during forward flight.	During return to base mast torques fluctuated between 40 - 45% with larger fluctuations when any flying controls were moved. Reporter confirms recurrence of previous fault. CAA Closure: The fault was traced to the nr2 NF governor. The engine manufacturer have introduced a Service Bulletin SB5511 to modify the operators fleet of governors to reduce the incidents.
201003525	24/04/2010	En route	Bristol International		EGTT : London (FIR)	DE HAVILLAND	Turboprop	2	UK Serious Incident: Nr2 engine malfunction during flight. Engine shut down. PAN declared. Diverted and landed on single engine. Two POB, no injuries. AAIB Field investigation.	After a base maintenance check at Exeter, the a/c was flown uneventfully to East Midlands to be re-painted. During the return flight to Exeter the RH engine suffered a significant oil leak and lost oil pressure. Accordingly the flight crew shut it down. Subsequently, the crew noticed the LH engine was also leaking oil with a fluctuating oil pressure, so they initiated a diversion to Bristol, where they landed safely. The oil leaks were traced to damaged O-ring seals within the oil cooler fittings on both engines. Both oil coolers had been removed and refitted during the base maintenance check at Exeter. It was probably during re-installation that the O-ring seals were damaged. A number of factors led to this damage and to missed oil leak checks. Six Safety Recommendations, nrs 2011-014, 016 and 017 addressed to Maintenance Organisation, nr 2011-15 addressed to the a/c manufacturer, nr 2011-18 addressed to the European Aviation Safety Agency and nr 2011-19 addressed to the Civil Aviation Authority, are made. AAIB Bulletin 06/2011, Ref: EW/C2010/04/03. □ CAA Closure: □ CAA FACTOR F4/2011 detailing the CAA response to the AAIB recommendation was issued on 31 August 2011.
201003764	03/05/2010	Take-off	Luton (LUT)		EGTT : London (FIR)	EMBRAER	Turbofan	2	Nr1 engine fire warning after take-off. ORH actioned and engine shut down. PAN declared. Aircraft returned. Fuel burnt off in hold prior to landing. Fire detection system fault.	Engine EICAS messages disappeared more or less as fire handle was pulled and engine fire extinguishers were not used. Uneventful single engine landing carried out with momentary fire warning on touchdown. Aircraft escorted to standby fire services that later were unable to locate any trace of a fire in nr1 engine. Subsequent investigation revealed a fire detection system fault - failed components replaced and aircraft released to service. Company review of flight crew procedures/actions carried out and NATS to be contacted concerning possible ATC/pilot review.
201003879	13/04/2010	En route	Chicksands	3nm SE	EGTT : London (FIR)	EUROCOPTER	Turboshaft	2	Nr1 engine chip caution illuminated during cruise. Checklist actioned. Engine shutdown.	Fuzz burn cleared caution for a few seconds then caution returned. Aircraft landed at destination. Fault diagnosis carried out with 1 chip (approx 0.5mm²) removed from rear plug and filter showing evidence of further chips.
201004007	09/05/2010	Approach	Bicester	1nm E	EGTT : London (FIR)	CESSNA	Reciprocating	1	UK Reportable Accident: A/c crashed during attempted forced landing in a field due to engine malfunction. Two POB, no injuries. AAIB AARF investigation.	CAA Closure: The a/c suffered a power loss of unknown cause whilst in the cruise. The subsequent forced landing resulted in significant damage to the a/c. AAIB Bulletin 09/2010, Ref: EW/G2010/05/05.
201004051	07/05/2010	En route	Bristol (City)		EGTT : London (FIR)	PIPER	Reciprocating	2	PAN declared as RH engine shutdown. Full emergency initiated. Aircraft landed safely with fire service in attendance.	
201004343	16/05/2010	En route	London-Heathrow - LHR		EGTT : London (FIR)	BOEING	Turbofan	2	B767 crew reported an acrid smell in the flight deck at 6000ft whilst inbound. Subsequently on taxi-in, crew noticed nr2 EPR gauge fluctuations from 1.01 to 1.10.	Nr1 engine shutdown during taxi-in. □ CAA Closure: Initially suspected to be a volcanic ash event, however, no volcanic ash contamination was found on the airframe or engines. The root cause of the acrid smell in the flight deck was not engine related. The EPR fluctuation cannot be explained as it was not captured on the QAR (quality awareness report) or reproduced on subsequent ground runs. No further investigation deemed necessary by the operator.
201004422	18/05/2010	En route	Lambley (Nottinghamshire hire)		EGTT : London (FIR)	OTHER	Reciprocating	1	UK Reportable Accident: Forced landing in a field due to engine failure. Pilot evacuated a/c, which then caught fire. One POB, no injuries. A/c destroyed. AAIB AARF investigation.	CAA Closure: Whilst cruising at 2000ft the engine lost power. A forced landing was made in a furrowed field and as the a/c came to a halt a fire broke out. The pilot, who was uninjured, exited the a/c unaided. The a/c was subsequently destroyed by the fire. AAIB Bulletin 09/2010, Ref: EW/G2010/05/10.
201004718	25/05/2010	Approach	Bristol Filton		EGTT : London (FIR)	DIAMOND	Reciprocating	2	Engine power loss.	After an approach and a simulated RH engine failure on the go-around, the RH engine initially responded to 100% before retarding to 80% and then returning to 100%. Subsequent surges resulted in increasing power loss until the engine settled down at 2% power indication. Engine shut down and restart unsuccessfully attempted. The aircraft returned to base. The reporter notes there were no ECU faults or other engine malfunctions indicated. Clutch assembly changed.
201004903	30/05/2010	En route	Cottesmore	11nm W	EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	2	RH engine in-flight shut down due to illumination of chip warning light. Diversion. Full emergency declared by ATC.	Chip RH' caution illuminated during cruise, speed reduced and power 'Eng P' caution began to flash intermittently. Engine shutdown. Diversion initiated. Upon landing, flight crew elected not to restart the engine because of oil pressure problem. Engineering inspection found numerous chips on forward chip detector. Rear chip housing removed due to excessive debris on rear chip detector. Engine manufacturer informed and engine retained for manufacturer investigation.
201005826	20/06/2010	En route	Runswick Bay		EGTT : London (FIR)	CESSNA	Reciprocating	1	MAYDAY declared due to engine failure. Safe forced landing in a field. Two POB, no injuries.	A/c on its penultimate training flight prior to being positioned for a replacement engine to be installed. Following the forced landing, the front LH cowling was found to be bent open at its forward edge, engine oil was evident around the nose wheel and nr1 cylinder had separated. □ CAA Closure: Nr1 cylinder failure due to corrosion. This is a known problem and is addressed by EASA SIB 2009-24. SIB recommends repeat inspections.
201005912	22/06/2010	Approach	Gloucester-Staverton		EGTT : London (FIR)	PIPER	Reciprocating	1	UK Reportable Accident: A/c landed short of the runway. One POB, no injuries. Substantial a/c damage. AAIB AARF investigation.	CAA Closure: During final approach, the pilot increased the throttle but the engine did not respond. The a/c had insufficient airspeed and altitude to reach the airfield and crashed into a hedge short of the runway. AAIB Bulletin 10/2010, Ref: EW/G2010/06/23.
201006034	24/06/2010	En route	Cranwell		EGTT : London (FIR)	BEECH	Turboprop	2	RH engine in-flight shut down due to unusual/erratic indications. A/c returned to base.	On departure RH engine was noted to be running hotter than expected with torque oscillating +/- 100ft/lbs. Engine oil pressure then exceeded its limit of 135psi and began to fluctuate. Subsequent investigation revealed an inaccuracy and fluctuation of oil pressure indicator and play in input to propeller governor control that might have contributed to unstable propeller pitch and hence fluctuation torque. Pressure indicator replaced, propeller governor control correctly adjusted and engine ground run carried out with no fluctuations apparent. Engine temperature indication system checked and found within manufacturer's limits. Airborne check revealed that RH engine oil pressure and ITT were higher than LH engine indications and torque fluctuation was approx +/-10 Tq but all parameters were within acceptable limits. A/c released to service with no further incidents. Engine manufacturer advised.
201006150	28/06/2010	En route	Leeds Bradford (LBA)		EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	2	During cruise, nr1 engine torque reduced along with oil pressure and temperature, which was followed by illumination of oil pressure light.	Engine shutdown in accordance with Quick Reference Cards (QRC). PAN declared and a/c diverted. Successful single engine approach and landing made. Investigations found a failure of engine oil line union thread in engine accessory gearbox. Engine assembly replaced with accessory gearbox being returned to overhaul shop for inspection/repair.
201006291	29/06/2010	En route	Durham Tees Valley (TD)		EGTT : London (FIR)	PIPER	Reciprocating	1	A/c suffered stuck throttle.	A/c returned due to a jammed throttle. Full emergency initiated. A/c conducted a fast glide approach and landed safely but the engine then stopped. The a/c was able to free wheel to vacate the runway but was unable to clear the holding boards. Fire crew pushed the a/c clear of the runway and the incident was stood down. □ CAA Closure: The a/c was inspected and it was found that a clamp came loose on the throttle control cable. The event was considered to be an isolated occurrence.
201006371	01/07/2010	Take-off	Southampton (SAM)		EGTT : London (FIR)	DE HAVILLAND	Turboprop	2	RTO at 40kts due to 'Double Bleed Hot' caution. A/c taxied clear of runway and returned to stand. Tech Log annotated.	

201006634	04/04/2010	En route	Bournemouth		EGTT : London (FIR)	PIPER	Reciprocating	1	Engine failure during approach.	"Small Rumble" noted from the engine during flight. Return to base initiated. Engine then started to misfire with subsequent power loss before stopping when on base leg. Landed safely following a gliding approach. Although the pilot then restarted the engine, it only continued operating when set to full power. Investigation found that all basic engine settings were outside manufacturer's specificationswith the fuel system being set too lean for both high andlow pressure settings. Investigation being progressed under 201005336.
201006713	06/07/2010	En route	Eshott		EGTT : London (FIR)	RANS	Reciprocating	1	UK Reportable Accident: Forced landing in a field due to engine failure. One POB, no injuries. Damage to nose wheel. AAIB AARF investigation.	CAA Closure: The a/c took off from R/W26 at Bockenfield. The wind was from 270deg at between 10 and 12kts, visibility 20km, cloud scattered at 3000ft amsl and the temperature was 17deg C. Although the before take-off power checks and the take-off itself were normal, the climb rate seemed to the pilot to be lower than normal. On reaching 250ft agl, the pilot turned the a/c right through 90deg, at which point the engine "lost power". The pilot reported that he selected the most suitable landing area available noting that its orientation meant he would have to make a downwindlanding. Following touchdown the a/c ran towards the fence at the far end of the field. The pilot managed to turn the a/c away from the fence but the nosewheel buckled before the a/c came to a halt. When submitting his report the pilot did not know the cause of the engine failure. AAIB Bulletin 10/2010, Ref: EW/G2010/07/02.
201006944	10/07/2010	En route	Burton Latimer (Northampton shi	Findon	EGTT : London (FIR)	CFM	Reciprocating	1	UK Reportable Accident: Forced landing due to engine failure. One POB, no injuries. Nose cone and nose wheel damaged. AAIB AARF investigation.	CAA Closure: The a/c was in flight when, approximately 10nm north-east of the destination and at a height of about 1500ft agl, the engine lost power over a period of 5secs. Attempts to restart the engine failed. The prevailing windwas southerly at 15-20kts, reducing to 10kts at the surface. The pilot turned the a/c into wind and made a MAYDAY call. He identified a field and carried out a forced landing. The landing was abrupt and resulted in damage to the nose wheel, nose cone, fuselage and strobe but no injury to the pilot. The pilot cancelled the MAYDAY, turned off the fuel and electrical power and vacated the a/c. Having exited the a/c the pilot discovered that he had landed across Wold Lodge farm strip. The strip runs east to west and hada standing crop about 18 inches high on either side. The pilot reported that there was sufficient fuel and oil onboard. The weather conditions were conducive for a moderate risk of carburettor icing using cruise power and a seriousrisk with descent power. At the time of this report, the cause of the engine failure was unknown. AAIB Bulletin 01/2011, ref: EW/G2010/07/06.
201007583	26/07/2010	Take-off	Birmingham	5 N	EGTT : London (FIR)	DE HAVILLAND	Turboprop	2	Nr2 engine shutdown due to a drop in fuel pressure. Smellof fuel reported in the cabin. PAN declared and a/c returned.	CAA Closure: The primary ejector pump flapper valve was found detached and jammed in the fuel line. Nr2 primary ejector pump replaced. The operator is currently monitoring this event type.
201008051	03/08/2010	Take-off	Birmingham		EGTT : London (FIR)	AIRBUS	Turbofan	2	MAYDAY declared due to nr1 engine failure just after take-off. Drills completed and a/c returned.	After departure, several loud bangs heard by flight crew and smoke/flames observed omitting from LH engine by ATC. MAYDAY declared and full emergency initiated. Engine shutdown by flight crew. A/c returned to a safe landing with fire service in attendance.□ CAA Closure: The failure was a result of a distressed HPT stage 1 blade outer air seal. The operator was part way through a programme to embody SB 72-0483 at the next shop visit for each engine. The enginethat failed was due for removal for shop visit 35 days later on 07 Sep 2010. The operator has instigated accomplishment of the SB 72-0580 for the remaining un-modified engines that have reached the time and cycles thresholds and will commence inspection regardless of the EGT margin remaining.
201008185	06/08/2010	En route	Stansted		EGTT : London (FIR)	CESSNA	Reciprocating	2	MAYDAY declared due to RH engine shutdown. Diverted.	
201008685	19/06/2010	Take-off	Old Sarum (Wiltshire)	Nr Airfield	EGTT : London (FIR)	OTHER	Reciprocating	1	UK Reportable Accident: Power loss followed by engine stopping. Forced landing off aerodrome. One POB, minor injuries. AAIB AARF investigation.	CAA Closure: The a/c had been flown earlier that morning to take part in the 'Fly-UK 2010' round-Britain event. Thepilot completed the pre-flight checks and the a/c then took off. At around 800ft agl the engine started to lose power and a few seconds later, stopped. The pilot had a limited choice of options for a forced landing and chose a narrow strip of long grass alongside a fence. During the approach the pilot allowed the airspeed to decay excessively and the a/c stalled at a height of between 6 and 10 ft. It then struck the ground, damaging the landing gear and both wings: the pilot was uninjured. The fuel pipe in the wing tank had recently been replaced and the pilot considered that a fuel problem associated with this pipe might have been a contributory factor. AAIB Bulletin 11/2010, Ref: EW/G2010/06/38.
201009149	30/08/2010	En route	Fairoaks	4nm NE	EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	2	LH engine fire warning at 1300ft during cruise. Checkl istactioned. Diversion. Uneventful single engine landing with fire services in attendance.	
201009668	01/09/2010	Take-off	Riseley (Bedfordshire)	Sackville Farm Airstrip	EGTT : London (FIR)	OTHER	Reciprocating	1	UK Reportable Accident: Engine failure during take-off. Forced landing in a field. One POB, no injuries. A/c destroyed. AAIB AARF investigation.	CAA Closure: The pilot had been flying circuits for approximately 30mins with no abnrmal indications. Then, following rotation and climb out to 200ft agl, the engine stopped abruptly with the rpm dropping to zero. The pilot landedin a field but touched down fast at around 50mph. The nosewheel dug into the ground and the a/c rolled over, causing extensive damage to the airframe but no injuries. AAIB Bulletin 02/2011, Ref: EW/G2010/09/02.
201010938	01/10/2010	En route	En Route		EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	2	MAYDAY declared due to engine in-flight shutdown following 'Oil Temp' and 'Eng 1 Chip' cautions.	In cruise the 'Oil Temp' caution illuminated with no associated alarm caution. FRC actioned and flight continued with all gauges operating within normal limits. Approx 5minslater 'Eng 1 Chip' caution illuminated. PAN declared and diversion initiated. Engine then shutdown law FRC and as result PAN upgraded to MAYDAY. Uneventful landing carriedout with fire service in attendance. Investigations foundmetal debris on both electrical mag plugs. A/c to be recovered by road for engine replacement.
201011283	10/10/2010	Take-off	London-Gatwick - LGW		EGTT : London (FIR)	DE HAVILLAND	Turboprop	2	Nr2 engine oil pressure indications below normal limits (approx 25psi). No associated warnings. ECL actioned. PAN declared. Precautionary engine shutdown. A/c returned.	Normal single engine approach and landing carried out. Runway vacated and after agreement with fire service, a/c taxied to stand. Investigation being progressed under 201006975.
201011436	11/10/2010	En route	Gloucester-Staverton (Gloucester)	5 NE	EGTT : London (FIR)	OTHER	Reciprocating	1	UK Reportable Accident: Engine failure during flight. Forced landing in a field. One POB, no injuries. AAIB AARF investigation.	CAA Closure: The engine began to run roughly during flight although the oil temperature and pressures appeared normal; however, the rough running of the engine worsened withwhat the pilot described as "lots of mechanical noise". He decided to make a precautionary landing into a field. During the descent, as the a/c passed through 700ft amsl (approximately 570ft agl), the engine stopped. The a/c touched down in the field which had been recently cultivated andthe main wheels dug into the soft earth during the landing roll. The force on the landing gear legs bent them backwards and pushed them upwards into the stowed position. Thea/c came to a stop shortly afterwards. Apart from damage to the landing gear mechanism, the a/c suffered scratches to its underside. The pilot, who was wearing a full harness, was uninjured and informed ATC at Staverton that emergency services would not be required. A subsequent inspection of the engine revealed damage to the crankcase around the Nr4 cylinder. AAIB Bulletin 03/2011, Ref: EW/G2010/10/09.
201012190	30/10/2010	En route	River Derwent (South Yorkshire)	Nr Aughton	EGTT : London (FIR)	AVIONS ROBIN	Reciprocating	1	UK Reportable Accident: A/c ditched into river and becamesubmerged. Two POB, no injuries. AAIB AARF investigation.	CAA Closure: The a/c reportedly suffered an engine failure and was ditched into the River Derwent. The pilot and his passengers escaped wet but uninjured. AAIB Bulletin 05/2011, Ref: EW/G2010/10/19.
201012252	15/10/2010	En route	English Channel		EGTT : London (FIR)	AGUSTA	Turboshaft	2	Nr1 engine shutdown and diversion initiated due to high engine oil temperature.	Nr1 engine oil temperature started to rise outside normallimits. Nr1 engine mode switch was set to 'Ground' but the temperature continued to rise. Within a few seconds the master caution was triggered and the engine shutdown in accordance with the flight manual. Maximum indicated oil temperature was 132deg C. A/c diverted for engineering support. Investigations found the thermostatic valve failed to operate causing oil to bypass the oil cooler.
201012499	07/11/2010	Take-off	Birmingham		EGTT : London (FIR)	FOKKER	Turbofan	2	Engine failure during the climb. MAYDAY declared. A/c returned.	LH engine failure due, it was initially believed, to multiple birdstrikes at 1000ft during climb out. 'Nr1 Engine Fail' warning on Central Display. Engine shut down and nr1 fire bottle discharged. MAYDAY declared although subsequently downgraded to PAN. A/c returned. FDR downloaded, whichconfirmed nr1 engine fuel control unit failure.
201013122	21/11/2010	En route	Nottingham East Midlands		EGTT : London (FIR)	BOEING	Turbofan	2	RH engine failed approximately 10nm from touchdown. MAYDAY declared. Full emergency initiated by ATC. QRH actioned.Uneventful single engine landing carried out.	CAA Closure: The investigation found the cause to be a sticking fuel flow governor bypass valve. The operator is currently overhauling FFG's at engine shop visits and in theprocess of setting up a hard time on wing life control for the HP fuel pump.
201013356	26/11/2010	En route	Humberside	7.3 W	EGTT : London (FIR)	CESSNA	Reciprocating	1	Engine failure. MAYDAY declared. A/c landed in a field. One POB, no injuries.	
201013847	10/12/2010	En route	Bristol Filton		EGTT : London (FIR)	DIAMOND	Reciprocating	1	Engine failure in flight.	Engine ran roughly approximately 15mins into flight. MAYDAY declared and diversion initiated. Approximately two miles from touchdown, the engine stopped. A glide approach continued to landing.

201014103	20/12/2010	En route	Midhurst (MID)		EGTT : London (FIR)	BEECH	Turboprop	2	Diversion initiated as LH engine shut down due to excessive oil temperature.	Diversion airfield initiated a full emergency. A/c landed safely. Fault confirmed to be oil temperature indicator. No evidence of mechanical failure.
201014496	11/12/2010	En route	Sandown		EGTT : London (FIR)	CESSNA	Reciprocating	1	MAYDAY declared due to engine failure. Landed safely without injury or a/c damage.	
201100722	24/01/2011	Take-off	London-Heathrow - LHR		EGTT : London (FIR)	BOEING	Turbofan	4	Birdstrike on rotation. A/c returned with nr2 engine shutdown due to engine vibration. Damaged fan blades found on arrival.	
201102072	25/02/2011	En route	Stapleford		EGTT : London (FIR)	PIPER	Reciprocating	2	PAN declared due to LH engine failure. Propeller feathered, engine shut down and secured for an uneventful single engine landing.	
201103216	21/03/2011	Take-off	London-Heathrow - LHR		EGTT : London (FIR)	BOEING	Turbofan	4	Take-off rejected due to TOGA thrust failing to engage. Second take-off rejected for the same reason. N1 set manually prior to a successful take-off.	During the cruise, autothrust CB (C4) found to have tripped. FMC Master selected to RH FMC. Autothrust successfully re-engaged.
201103367	04/04/2011	En route	Southampton (SAM)		EGTT : London (FIR)	BAE	Turboprop	2	MAYDAY declared due to RH engine shutdown. A/c squawked 7700. A/c returned.	CAA Closure: The engineering investigation revealed that the cannon plug on the front of the reduction gearbox which carries the torque bridge signal output to the torque conditioner had become contaminated with oil. This then corrupted the output signal causing the fluctuating indication as noted by the crew. Again as a function of this, the torque limiting system became active and modified the fuel flow causing the a/c to yaw. The cannon plug and socket were cleaned and full engine runs carried out with no further problems noted. A fleet check also revealed no similar issues.
201103712	11/04/2011	En route	En Route		EGTT : London (FIR)	BOEING	Turbofan	4	Due to engine failure, a/c dumped fuel before diverting.	
201103885	14/04/2011	En route	Kirkby		EGTT : London (FIR)	EUROCOPTER	Turboshaft	2	Nr2 engine chip caution illuminated during cruise. Fuzz burner operated but caution did not clear. Engine shutdown and a/c returned to base.	Slight debris found.
201104207	22/04/2011	Take-off	Luton (LUT)		EGTT : London (FIR)	AIRBUS	Turbofan	2	Birdstrike to nr1 engine on take-off causing engine vibration during initial climb. Engine shutdown, MAYDAY declared and a/c returned.	On take-off roll above 100kts PF noticed birds flying past a/c. Shortly after a noise heard by both pilots. Engine parameters checked and were normal at this stage. Once airborne nr1 engine vibration indications were off the scale. Engine was retarded to idle and MAYDAY declared. Emergency action initiated by ATC and runway inspection carried out with bird remains found. Return initiated. Nr1 engine shutdown as the engine had probable damage due to stall and high EGT. Normal approach and landing carried out. Single fan blade damaged.
201104242	21/04/2011	En route	Shoreham		EGTT : London (FIR)	DIAMOND	Reciprocating	2	PAN declared. Engine shut down by pilot due to unidentified noise.	
201104442	29/04/2011	En route	En Route		EGTT : London (FIR)	BOEING	Turbofan	2	Emergency declared due to one engine shut down because of low oil pressure.	
201104611	26/04/2011	Approach	Exeter		EGTT : London (FIR)	BEECH	Reciprocating	2	PAN declared due to LH engine shut down. Local emergency services called and a/c landed without further incident.	
201104747	27/04/2011	En route	Gloucester-Staverton		EGTT : London (FIR)	OTHER	Unknown		A/c returning due to low oil pressure followed by PAN declaration due to starboard engine shut down.	
201105204	16/05/2011	Take-off	Bristol International		EGTT : London (FIR)	CESSNA	Turbofan	2	As a/c entered runway for take-off, ATC and following a/c reported smoke from engine. Engine shut down and fire service called. Airfield closed. A/c towed to parking area.	Runway inspection carried out prior to resumption of operations.
201105281	18/05/2011	Take-off	Bournemouth (Dorset)	Kinson Manor Farm	EGTT : London (FIR)	BEECH	Turboprop	2	UK Reportable Accident: A/c crashed in a field shortly after take-off. Substantial damage. Two POB, no injuries. AAIB Field investigation.	CAA Closure: The a/c's climb rate was lower than expected after take-off and it was subsequently unable to maintain altitude. The pilot made a forced landing into a field. The cause of the apparent power loss was not determined. AAIB Bulletin 02/2012, Ref: EW/C2012/05/03.
201105887	26/05/2011	Approach	Oxford		EGTT : London (FIR)	EUROCOPTER	Turboshaft	2	PAN declared and engine shutdown due to engine chip light caution operating. ATC initiated a local standby with fire vehicles in attendance. A/c landed safely.	
201106013	02/06/2011	Take-off	Kemble		EGTT : London (FIR)	EXTRA	Reciprocating	1	Engine failure during take-off run.	Engine lost power and ran roughly at approx 60ts with smoke evident from cowlings. Engine shut down and a/c brought to a halt and vacated with fire services in attendance. Large oil leakage evident from underside of engine.
201106460	08/06/2011	En route	Leicester		EGTT : London (FIR)	AGUSTA	Turboshaft	2	PAN declared due to nr1 engine chip light illumination.	During first flight post engine change, oil chip caution illuminated. Nr1 engine shut down as a precaution. ECL carried out. A/c continued and fire services attended.
201106552	13/06/2011	Approach	Coventry		EGTT : London (FIR)	DIAMOND	Reciprocating	2	Full emergency initiated due to a/c arriving with LH engine shutdown.	A/c landed safely but was unable to ground manoeuvre with one engine. A/c shut down, therefore blocking the runway. Fire service dispatched and a/c pushed onto stand.
201106677	14/06/2011	Approach	Kemble		EGTT : London (FIR)	GLOSTER	Turbofan	2	MAYDAY declared due to LH landing gear failing to extend.	Pilot reported that unable to cycle the LH gear down. A fly through for visual inspection was completed and all gear appeared extended, however unfamiliarity with the a/c gear configuration negated a positive response being delivered. MAYDAY and full emergency declared. Pilot reported closing down one engine to conserve fuel. Pilot was requested to hand pump the gear one more time, then reported that LH engine fully closed down, the gear was indicating fully down and that fuel was running low. Pilot downgraded emergency to a PAN and a/c landed without further incident. □ CAA Closure: The u/c indication occurred on the first flight since rebuild and was attributed to a sticking microswitch in the gear indication system, which cleared during the flight and could not be replicated on subsequent undercarriage cycling ground tests. The a/c has flown several times since, without any recurrence of the fault and has successfully completed the test flight programme leading to a Permit issue.
201106882	17/06/2011	En route	En Route		EGTT : London (FIR)	SIKORSKY	Turboshaft	2	Loss of nr1 engine oil pressure during cruise.	Shortly after take-off, whilst levelling, a flash of the Master Caution drew crew attention to the CWP. No warnings present, so "Recall" soft key used to access last advisory which indicated nr1 "Low Oil Pressure". Nr1 oil pressure seen to be fluctuating between 44-54 psi, so crew elected to divert, whilst monitoring pressure indications. Pressure noted to be fluctuating progressively lower, and occasionally entering precautionary yellow segment, so crew set nr1 engine to idle and declared a PAN call. Approaching ILS localiser, nr1 oil temperature noted to be rising, so engine shutdown fully, and ATC notified. ILS continued to un-eventful landing, and a/c taxied to ramp with fire service in attendance.
201107074	24/06/2011	Take-off	Elstree		EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	2	During a rejected take-off exercise, the engine that had not been retarded, failed. A/c landed safely with no damage or injuries.	
201107336	29/06/2011	En route			EGTT : London (FIR)	CESSNA	Reciprocating	1	MAYDAY declared due to possible engine failure. Force landed in a field. One POB, no injuries. No a/c damage.	
201107622	04/07/2011	En route	Exeter	20	EGTT : London (FIR)	DIAMOND	Reciprocating	2	A/c returned due to RH engine failure. Full emergency procedures initiated. A/c landed safely.	
201108044	13/07/2011	En route	Farnborough		EGTT : London (FIR)	BOMBARDIER	Turbofan	2	RH engine in-flight shutdown due to low oil pressure. A/c returned.	After landing a/c taxied back to stand and RH engine cowling showed evidence of large oil leak from inboard side with large pool of oil evident on apron. Oil tank inspected and filler cap found closed and locked, although when cap removed 'O' ring seal found split. Oil loss three quarts (out of five). Seal replaced, oil replenished and subsequent ground runs/leak checks satisfactory.

201108193	18/07/2011	En route	Coventry		EGTT : London (FIR)	CESSNA	Reciprocating	2	Following an in-flight engine shutdown during a training exercise, engine failed to re-start. PAN declared followedby an uneventful single engine approach and landing.	Subsequent inspection found the engine running lean.
201108291	15/07/2011	Approach	Henstridge		EGTT : London (FIR)	ENSTROM	Reciprocating	1	Engine stopped during the circuit. Full autorotative landing carried out. Inspection revealed the a/c was out of fuel.	The reporter notes that both the instructor and student had dipped the fuel tank prior to take-off for a 15min flight, calculating there was sufficient fuel for 45mins of flight time. Subsequent discussion revealed an ambiguity of the dip stick calibration, resulting in the fuel contents being mis-read. Dipstick since recalibrated.
201108324	20/07/2011	En route	Doncaster		EGTT : London (FIR)	CESSNA	Turbofan	2	A/c climbing to FL210. Reaching FL180 a/c advised loss ofan engine. PAN declared and return/diversion requested.	
201108472	22/07/2011	Manoeuvring	EGHR (OUG): Chichester/Go odwood		EGTT : London (FIR)	NORTH AMERICAN	Reciprocating	1	UK Reportable Accident: A/c suffered engine failure during display practice. Forced landing. One POB, no injuries. A/c damaged. AAIB AARF investigation.	CAA Closure: During a high-speed, low-level pass as part of a practice air display, the low fuel pressure warning light illuminated and the engine stopped. A successful gearup landing was made in a nearby field. A subsequent inspection found no fuel in the tank selected although it was reported that the fuel gauges had each indicated about 30 gallons shortly before the engine had stopped. A later inspection of the a/c found no faults with the fuel system andabout 14 gallons in the reserve section of the LH wing fuel tank. The LH wing fuel tank uses an extended standpipe from which to take fuel. The fuel below the top of the standpipe is the reserve supply which can be selected on the fuel selector valve (the other selections are the LH tank,RH tank and off). The capacity of the reserve is 15.8 gallons which is included in the reading of the LH tank fuel gauge. The pilot stated that the fuel gauges had each indicated 30 gallons prior to the dive. However, the light illuminating the LH gauge was not working but the quantity seemed to agree roughly with the usage he was expecting based on the duration of the flight so far, and the duration of the previous flight told to him by the pilot of that flight. The pilot now believes he misread the gauge and that the time he had been told for the previous flight was in fact flight time only. AAIB Bulletin 01/2012, Ref: EW/G2011/07/23
201108732	28/07/2011	Manoeuvring	Valley	10 NW	EGTT : London (FIR)	BELL	Turboshaft	2	Loss of nr1 engine oil pressure during hover.	The Master Caution illuminated along with the nr1 oil pressure caption whilst completing a hoist operation. The oilpressure gauge indicated below 30 psi, and the oil temperature was in the normal range. A/c transitioned to forwardflight to ensure one engine inoperative (OEI) performanceand turned toward the nearest land. Nr1 engine oil pressure failure diagnosed and throttle closed with no change tool indications. Nr beeped and nr1 engine shut down usingthe throttle. The shut down checks were completed in accordance with the Flight Reference Cards and the a/c recovered to a safe landing.
201108988	31/07/2011	Take-off	Shobdon		EGTT : London (FIR)	CYCLONE AIRSPORTS	Reciprocating	1	Engine failure on take-off. Landed safely on a disused part of the airfield.	
201109129	01/08/2011	En route	Coventry	15 NE	EGTT : London (FIR)	PIPER	Reciprocating	2	PAN declared and diversion initiated due to loss of oil pressure.	A/c reported losing oil pressure in RH engine, PAN declared and engine shutdown. A/c requested diversion. Full emergency initiated. A/c landed safely but was unable to fullyvacate the runway. Engine re-started and a/c taxied to parking.
201109138	04/08/2011	Take-off	Bournemouth		EGTT : London (FIR)	BAE	Turboprop	2	Nr2 engine auto feathered during initial climb. PAN declared and engine shutdown.	During taxi, a moderately sized flock of starlings was observed. During initial climb both pilots heard a dull clunk from the RH engine, immediately followed by an increase in torque. The torque then fluctuated, power reduced in anattempt to reduce over torque. Right autofeather and leftengine up-trim was then recognised and engine shutdown iaw checklist. PAN declared. An uneventful single engine approach and landing carried out. Subsequent inspection by engineers found a sign of bird remains on the fuselage, but no evidence of damage to the engine. The dent on the spinner was already recorded on the dent and buckle chart. Power runs carried out and satisfactory results obtained. Engine to be monitored for performance.
201109181	05/08/2011	En route	En Route		EGTT : London (FIR)	DASSAULT	Turbofan	2	RH engine failure and in-flight shut down after loud thud was heard and felt through airframe at FL240 during cruise.	Engine secured iaw emergency checklist and uneventful VFR approach and landing carried out at planned destination. It was noted at time of engine failure that RH fuel pressure was indicating maximum full scale deflection. ☐ CAA Closure: The operator's investigations confirmed that the cause of the incident was failure of the HP fuel pump drive shaft. During the initial examination it was noticed the bleed valves were found to be only partially open and the pump splines were found to be rounded off. The accessory gearbox female splines for the fuel pump had indentation damage approximately 10mm down the splines. The FCU was inspected using approved data and found to be serviceable. The accessory gearbox and fuel pump were replaced and power assurance ground runs carried out and the a/c returned to service. The engine was approx half way through the HSI and the overhaul fh requirement (518 hrs and 2541 hrs to go respectively) and the fuel pump is subject to a 5000hr scheduled overhaul requirement.
201109537	12/08/2011	En route	Isle of Man (IOM)		EGTT : London (FIR)	DORNIER	Turboprop	2	RH engine shutdown due to overspeed warning. MAYDAY declared. A/c landed safely.	
201109957	24/08/2011	Take-off	Gloucester- Staverton		EGTT : London (FIR)	LONG	Reciprocating	1	UK Reportable Accident: Engine failure following take-off. Descended back to the runway and landed heavily. One POB, no injuries. Wing and tail wheel damaged. AAIB AARF investigation.	CAA Closure: The engine suffered a loss of power after take-off and the ensuing forced landing on an intersecting runway resulted in damage to the landing gear structure andwing. The fuel filler cap of the pressurised fuel tank was found loose which would have resulted in a loss of header pressure and this probably contributed to a fuel vapour lock. It is also possible that the electric fuel pump had not been turned on and this contributed to the reduced fuel pressure. AAIB Bulletin 2/2012 ref EWG2011/08/21.
201110134	27/08/2011	En route	EGFH (SWS): Swansea		EGTT : London (FIR)	BRITTEN NORMAN	Turboprop	2	UK Serious Incident: Both engines flamed out during icingconditions. No emergency declared. Both engines relit. A/c returned to a safe landing. AAIB Field investigation.	CAA Closure: Engine anti-icing was not selected on prior to the a/c entering engine icing conditions and both engines flamed out. In-flight restart is not assured on this engine type between one and ten mins after shutdown. After the a/c exited these icing conditions, both engines were successfully relit and the a/c landed without further incident. AAIB Bulletin 03/2012, Ref: EW/C2011/08/02
201110823	10/09/2011	En route	Bournemouth		EGTT : London (FIR)	LOCKHEED	Turboprop	4	Nr3 engine fire warning light illuminated intermittently and then stayed on. Engine shutdown iaw ECL.	After initial fire bottle discharge the warning light extinguished but reappeared several seconds later. After the second discharge the warning lights remained illuminated. Engineering investigation revealed a fault in the Zone 1 fire wire.
201112459	09/10/2011	Take-off	Sandtoft		EGTT : London (FIR)	JABIRU	Reciprocating	1	Engine failed after take-off. A/c landed in a field.	CAA Closure: The pilot was not fully understanding of theoperation of the aeroplane on a day when carburettor icing may be present. Further training has been provided.
201113009	18/10/2011	En route	En Route		EGTT : London (FIR)	BEECH	Turboprop	2	RH bleed air caption flickering during cruise. Drills completed. PAN declared and precautionary engine shutdown. A/c returned.	Fault traced to bleed air pressure switch. Switch replaced.
201114212	15/11/2011	En route	London- Heathrow - LHR (Greater		EGTT : London (FIR)	BOEING	Turbofan	2	PAN declared due to right engine surge. Single engine approach flown and manual landing carried out. Emergency services in attendance.	Right engine surge diagnosed upon initial descent. Abnormal vibration was present and engine control indications displayed. Engine considered suspect so a PAN was declared. Precautionary single engine approach was flown and a Flap 20 manual landing was carried out successfully. Right engine shutdown on taxi-in.
201114965	01/12/2011	En route	Coventry		EGTT : London (FIR)	DIAMOND	Reciprocating	2	PAN declared and a/c returned due to uncommanded shutdownof RH engine.	RH engine shut down and feathered during training flight.A/c landed safely but was unable to clear the runway and required assistance from RFFS. On investigation nr2 engineeran normally except unable to reach full propeller RPM. Propeller gearbox filter removed and replaced. Filter inspected and small amount of unidentified dirt was found. Propeller valve removed, inspected and cleaned.
201115022	06/12/2011	Take-off	London- Gatwick - LGW		EGTT : London (FIR)	BOEING	Turbofan	2	Both engines failed to spool up when TOGA pressed and thrust levers advanced to reduced take-off thrust. Engines failed to accelerate beyond 46%. Take-off aborted and the a/c returned to the stand.	
201200427	14/01/2012	En route	Sheerness (Kent)		EGTT : London (FIR)	THRUSTER	Reciprocating	1	UK Reportable Accident: In flight, the a/c's engine stopped. A/c made a forced landing in a field. One POB, no injuries.	CAA Closure: AAIB downgrade to 'Non-Reportable' from AARFInvestigation. No further investigation to be progressed by the AAIB.
201200478	16/01/2012	En route	EGNX (EMA): NOTTINGHAM EAST MIDLANDS		EGTT : London (FIR)	BAE	Turboprop	2	RH engine shut down and PAN declared due to engine torquenot reducing below 35% Tq.	Checklist consulted. After initial actions had not rectified the problem, engine shutdown. PAN declared. A/c landedsafely. Full emergency action initiated. Investigations found roll pin had sheared on the nr2 engine control flightidle baulk lever.

201200804	17/01/2012	En route	En Route		EGTT : London (FIR)	AGUSTA	Turboshaft	2	Following replacement of nr2 engine thermostatic valve, oil temperature on nr2 engine went over limits on subsequent flight. Engine shut down and single engine flight continued.	
201201304	05/02/2012	Take-off	Eshott		EGTT : London (FIR)	RANS	Reciprocating	1	UK Reportable Accident: Engine stopped during initial climb. A/c returned. Unable to reach chosen runway and landedheavily on secondary runway. Two POB, no injuries. AAIB AARF investigation.	CAA Closure: The a/c engine stopped at low height, shortly after take-off. The pilot turned back to the airfield and attempted a landing on a secondary runway, but the a/c landed heavily, causing damage to the landing gear and forward fuselage. Neither occupant was injured. The cause of the engine failure had not been established at the time of reporting, but fuel starvation was considered by the pilotto be a probable cause. AAIB Bulletin 05/2012, Ref: EW/G2012/02/03.
201201405	07/02/2012	En route	London-Heathrow - LHR		EGTT : London (FIR)	AIRBUS	Turbofan	2	A/c diverted due to engine problems.	A/c reported flying with one engine at idle due to anti-icing problems. A/c diverted for engineering assistance. ATC advised D&D and requested pilot to squawk 7700. A/c landed safely.
201201423	08/02/2012	En route	Eshott		EGTT : London (FIR)	CESSNA	Reciprocating	1	MAYDAY declared due to rough running engine. A/c made an emergency landing on a private site.	Emergency services alerted and ATC contacted the site.
201201790	17/02/2012	Take-off	London-Heathrow - LHR		EGTT : London (FIR)	BOEING	Turbofan	4	Loss of thrust from nr4 engine.	Yaw was noticed followed by 'ENG 4 RPM LIM' warning. QRH drill carried out and, following discussion with maintenance control, the decision was made to continue with the flight. On arrival, engineers replaced VIGV (variable inlet guide vane) controller, LH and RH VIGV RAMS and air filter.Tested satisfactory.
201201847	03/01/2012	En route	Newport		EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	2	Nr2 engine chip warning during flight.	Engine shut down and re-lit for landing. Engine removed and all three modules replaced. Metal generation traced to engine accessory gearbox.
201201930	14/02/2012	En route	En Route		EGTT : London (FIR)	AGUSTA	Turboshaft	2	In cruise at 1000ft, nr2 engine 'Oil Hot' illuminated on nr1 EDU. All other indications normal. Power reduced and a/c slowed to 80kts. Caption remained illuminated at temperature of 123deg.	Nr2 engine mode switch selected to idle, continued flightto observe any changes in indication. Nr2 engine mode selected to off. Actions carried out iaw FRCs, engine oil temperature reduced to 123deg. Precautionary single engine landing made.
201202141	27/02/2012	En route	Shawbury (SWB)		EGTT : London (FIR)	BELL	Turboshaft	2	PAN declared and a/c returned due to nr2 engine governor malfunction.	Nr2 engine torque fell to 15-20%. A/c recovered to straight and level flight at reduced power. Nr1 engine respondedto lever inputs but nr2 engine N1, ITT, oil pressure and N2 were low and unresponsive, consistent with a low-side governor malfunction. FRC drills actioned and a/c returned, landing safely.
201202153	01/03/2012	En route	En Route		EGTT : London (FIR)	BAE	Turbofan	4	PAN declared and a/c diverted due to nr4 engine failure.	Subsequent investigation found a broken throttle cable.
201202267	02/03/2012	En route	Fairoaks		EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	2	Single engine failure.	A/c landed safely with emergency services in attendance.
201202371	02/03/2012	En route	En Route		EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	2	PAN declared due to LH engine failure in flight.	The LH engine chip light illuminated briefly. Pilot initiated shutdown procedure during which the warning illuminated again and a sudden yaw to the right was experienced. The LH engine failed and full shutdown procedure was completed. A successful single engine landing was completed. □ CAA Closure: The failure was caused by a known design flaw in the compressor adapter coupling, which is covered by AD 2004-26-09 and expires 31 Dec 2012. The operator confirmed a new engine was installed and the AD complied with.
201202484	10/03/2012	En route	Isle of Wight	Overhead Ryde	EGTT : London (FIR)	PIPER	Reciprocating	1	PAN declared due to jammed throttle. A/c diverted and a full emergency initiated.	A/c advised of intention to make a slow continual descentand to switch off engine and fuel on final approach. D&D and S21 notified. A/c advised airfield in sight but readback to landing clearance was not received (due to emergencysituation) so was issued several times. A/c landed safelywith emergency services in attendance and was towed from the runway. Subsequent inspection revealed a broken throttle cable which has now been repaired.
201202885	19/03/2012	En route	Warton		EGTT : London (FIR)	BAE	Turbofan	4	PAN declared due to engine overspeed and subsequent shutdown in climb.	On passing FL220 engine nr4 automatically shutdown with an 'Engine Overspeed' amber caption. Emergency drills carried out and a return initiated. A/c landed safely with emergency services in attendance. Engineering investigations found that the overspeed controller had failed. Both overspeed controllers were replaced. Defective component sent for analysis.
201203515	01/04/2012	En route	Princes Risborough (Buckingham	Summers Leys Road	EGTT : London (FIR)	OTHER	Reciprocating	1	A/c suffered engine failure and made a forced landing in a field	During cruise, a rapid reduction in power was followed bythe engine stopping. Forced landing carried out into a field. Engine was found to be seized. Removal and inspectionof the engine revealed that the crankshaft had failed at the forward web adjacent to the nr4 connecting rod.
201204610	30/04/2012	En route	Rugby		EGTT : London (FIR)	DIAMOND	Reciprocating	2	Single engine landing following in-flight engine shutdown.	Training flight practising engine shutdown and re-start. RH engine shut down correctly and the un-feathering drill followed but the propeller did not un-feather. When enginestarter was cranked there was excessive vibration so elected to leave the engine feathered and return. A/c landed safely but was unable to turn fully so had to be pushed from the runway. Emergency services in attendance.
201204758	04/05/2012	En route	En Route		EGTT : London (FIR)	FOKKER	Turbofan	2	PAN declared and a/c diverted due to engine shutdown.	Low oil pressure caused engine to be shut down in flight.A/c declared an emergency and requested diversion, descent and vectors given and a/c landed safely with emergency services in attendance.
201205098	14/05/2012	En route	Newquay	10nm NorthWest of Newquay	EGTT : London (FIR)	OTHER	Unknown		PAN declared and a/c diverted following engine malfunction.	A loud bang was heard in flight followed by violent motions through the airframe. Pilot shut down nr3 engine and declared a PAN. A/c landed safely with emergency services inattendance.
201205549	23/05/2012	En route	Leicester		EGTT : London (FIR)	SCHWEIZER	Reciprocating	1	Engine failure during approach. MAYDAY declared.	Approximately 20mins into the training flight, the circuit was joined at 700ft for an autorotation to a power recovery. After entering the auto it became apparent that the engine had stopped. A full engine off landing was carried out safely and there were no injuries to the two POB. No damage to the a/c although the stinger touched the ground in the flare. □ CAA Closure: Investigation found a faulty fuel injector servo. Component overhauled and refitted.
201205563	23/05/2012	En route	Leeds Bradford (LBA)		EGTT : London (FIR)	DIAMOND	Reciprocating	2	MAYDAY call following engine failure.	Full emergency initiated, a/c landed safely with emergency services in attendance.
201205593	25/02/2012	Approach	Hinton in the Hedges		EGTT : London (FIR)	GROB	Reciprocating	1	Engine shutdown in flight due to loss of oil pressure.	A/c had previously had an oil leak from nr4 cylinder which the pilot was told had been rectified. Oil pressure was checked prior to flight and all seemed in order but it deteriorated during the flight and dropped very quickly to zero. This forced a precautionary engine shutdown and a PAN was declared due to parachutists in the vicinity and the need for a glide approach. The a/c landed safely. Engine logbook unavailable for inspection.
201205745	25/05/2012	En route	Swanage (Dorset)		EGTT : London (FIR)	AGUSTA BELL	Turboshaft	2	PAN declared and a/c returned following nr1 engine shutdown.	Nr1 'Engine Oil' caption illuminated, followed by nr1 'Engine Oil Temp Rise' which went from to amber to red (161°C). Engine shutdown iaw emergency operating procedures. Single engine landing carried out safely.
201205921	30/05/2012	En route	Farnborough		EGTT : London (FIR)	PIPER	Reciprocating	1	MAYDAY declared due to engine failure	ATC received the MAYDAY call and assisted a/c with adviceon surface wind in the area of the landing location and informed D&D but then the a/c disappeared from radar. ATC requested an a/c in the vicinity to check out the area. Thea/c followed directions and reported back that the first a/c had landed safely in a field and that the two POB had no injuries.
201206228	07/06/2012	En route	En Route		EGTT : London (FIR)	BOEING	Turbofan	2	PAN declared and a/c diverted due to engine anti-ice problems.	Nr1 engine cowl anti-ice light illuminated. QRH actioned and engine reduced to idle. A/c had to divert due to the necessity of a single engine landing and the length of runway at destination. Warning light did not extinguish until after 10-15mins with engine at idle.
201206431	07/06/2012	En route	En Route		EGTT : London (FIR)	AGUSTA	Turboshaft	2	Engine nr2 pressure warnings seen on main EDU together with high pressure value on secondary EDU. PAN declared and engine shut down.	Nr2 engine oil temperature seen to be rising above normalvalues. A single engine approach and landing carried out with airport fire service in attendance.
201206453	11/06/2012	En route	Isle of Man (IOM)		EGTT : London (FIR)	PIPER	Reciprocating	2	PAN declared due to RH engine running rough and power loss.	RH engine manifold pressure rapidly dropped. Power reduced to idle setting and a/c landed unevenfully with emergency services on standby. Whilst taxiing in, oil was seen streaming from the top and side of the cowlng. Inspection of the engine confirmed the exhaust pipe section for nr6 cylinder had an 80% circumferal crack. Exhaust pipe fractured and detached from turbo charger connecting flange. The company concluded that a nr6 cylinder lower hold down stud had failed which allowed flexing of the cylinder on the crank case and a subsequent crack. Concurrent with this, the exhaust section connected to the cylinder and back to the turbo charger was also subject to flexing loads which lead to the complete failure at the exhaust pipes turbo charger input flange and subsequent loss of manifold pressure.

201206670	10/06/2012	En route			EGTT : London (FIR)	BOLKOW	Turboshaft	2	During climb out, nr1 engine Turbine Outlet Temperature rose towards maximum continuous of 779deg at 70% torque. A/c levelled, engine shut down and a/c returned.	The investigation found a build up of matter in the diffuser duct behind the axial compressor stage identified as grass. Once the plaque had been removed TOT lowered by 60deg and full performance restored.
201207165	26/06/2012	Take-off	Luton (LUT)		EGTT : London (FIR)	ATR	Turboprop	2	Serious Incident: MAYDAY declared and a/c returned following RH engine shut down. A/c landed, almost leaving the runway before coming to a halt. Hydraulic fluid found present on the runway.	CAA Closure: AAIB downgrade to 'Non-Reportable' from AARFInvestigation. No further investigation to be progressed by the AAIB.
201207518	04/07/2012	Take-off	London-Heathrow - LHR		EGTT : London (FIR)	BOEING	Turbofan	4	MAYDAY declared and a/c returned following an engine fireand subsequent shutdown of engine nr4.	The a/c suffered severe damage to engine nr4. Fuel dumpedand an emergency landing was safely carried out.
201207607	17/05/2012	Take-off	Henlow		EGTT : London (FIR)	CESSNA	Reciprocating	1	Engine failure after take-off. A/c landed safely with no damage to a/c structure and no injuries to occupants.	Piston disintegrated in relatively new engine. □ CAA Closure: Initial investigation detected excessive oil loss and signs of overheating of one cylinder. Removal of the cylinder confirmed the piston was badly damaged and cracked. The engine had run around 500hrs and had been installed for approximately one year since overhaul by the OEM. The Maintenance Organisation considered the failure to be caused by 'detonation', following discussions with the OEM it was concluded that the failure was most likely to be due to this individual cylinder running at an excessively 'lean' mixture due to a leak in this particular cylinders inlet manifold. This is considered likely to have caused 'detonation' damage in the cylinder. Unfortunately as the cylinder and inlet manifold were removed during the initial investigation the inlet manifold could not be examined and this diagnosis could not be confirmed. The excessive engine oil loss would have been caused by the excessive crankcase pressure due to combustion gas pressure leaking through the piston. The engine was removed and following discussions, overhauled where it now continues to operate satisfactorily.
201207784	05/07/2012	En route	Biggleswade Common	4nm SE of Sandy	EGTT : London (FIR)	OTHER	Reciprocating	1	UK Reportable Accident: Engine failure. A/c landed smoothly before hitting a hidden ditch. One POB, no injuries. Damage to landing gear. AAIB AARF investigation.	CAA Closure: The a/c was descending through about 1,500ft prior to joining the circuit at Sandy Airfield when the engine lost power. The pilot carried out the appropriate actions to restore normal power, but without success. Although the engine continued to run, it would not produce more than 1,800rpm. The pilot selected an area of common ground in which to make a landing. The landing itself was successful, but the a/c encountered an unseen ditch which caused damage to the landing gear and airframe. Upon inspecting the engine, it was found that part of a valve rocker on the inlet valve side had sheared off. AAIB Bulletin 10/2012, Ref: EW/G2012/07/06.
201207834	10/07/2012	Take-off	Isle of Man (IOM)		EGTT : London (FIR)	PIPER	Reciprocating	2	A/c returned shortly after departure due to an oil leak.	Upon carrying out a cruise check, LH engine oil pressure noticed in the yellow. Oil was all over the foot well and flowing fast. Return initiated and a local standby requested. Normal landing with the LH engine shut down in the flare as the oil pressure went into the red. Oil contents checked on parking but the level was off the bottom of the dipstick and therefore less than 6qts. The relatively short flexible rubber hose to the back of the port engine oil pressure gauge was found to be split causing oil at engine pressure to leak into the co-pilot foot well area. The cause of the failure was attributed to the age of the flexible pipe, although reliability of this item has not previously been an issue.
201208274	21/07/2012	Take-off	EGKA (ESH): Shoreham		EGTT : London (FIR)	PIPER	Reciprocating	1	UK Reportable Accident: MAYDAY declared and forced landing in a field following engine failure. Two POB, no injuries. AAIB Field investigation.	CAA Closure: At about 200ft aal after take-off the engine suffered a sudden loss of power and the pilot initiated a forced landing. The aircraft touched down in a field at the end of the runway but then it hit a fence, a hedge and a large mound, which caused significant damage to the aircraft. The loss of power was caused by failure of a clamp between the turbocharger compressor outlet and the turbo pipe assembly. This clamp had failed due to a fatigue crack that had initiated at multiple sites on the inner diameter and then propagated through the thickness of the sidewall. Following the accident the maintenance organisation discovered another cracked clamp, which had not yet failed, on another aircraft fitted with the same engine type. Three Safety Recommendations, nr 2013-018, 2013-019 and 2013-020, all addressed to the engine manufacturer. AAIB Bulletin 10/2013, Ref: EW/C2012/07/06.
201208620	21/07/2012	Take-off	Otherton Airfield	Penkridge	EGTT : London (FIR)	THRUSTER	Reciprocating	1	UK Reportable Accident: A/c suffered engine power loss and landed in a field of tall crops. Two POB, no injuries. AAIB AARF investigation.	CAA Closure: After take-off on a training flight, the a/c's engine lost power. The commander took control and elected to make a 90deg turn to the right, towards a crop field, in order to avoid a hedge and power lines. During the landing the a/c's right wing touched the crop, resulting in a ground loop that damaged the wings, nose fairing and fuselage main tube. The a/c owner reported that following the accident the engine was stripped, revealing scoring marks on the exhaust side of both pistons, consistent with engine overheating and seizure. He attributed the engine failure to misadjusted carburettor jet needles in both carburettors, which caused the engine to run with a lean mixture and subsequently overheat. AAIB Bulletin 11/2012, Ref: EW/G2012/07/17.
201208808	24/07/2012	Approach	Farnborough		EGTT : London (FIR)	DE HAVILLAND	Reciprocating	1	Partial loss of power on approach which led to engine failure just prior to touchdown.	Report from pilot and ground based personnel would suggest the cause was an over rich mixture. Maintenance organisation are planning inspection and fault finding.
201209141	02/08/2012	En route	Oxford		EGTT : London (FIR)	PIPER	Reciprocating	2	Noticeable drop in a/c attitude and performance during climb. RPM fluctuating between 1400 and 1500. PAN declared, a/c returned and engine shut down as precautionary measure.	Engine subjected to extensive investigation to determine cause of loss in power. Nothing obvious found. A/c taken for extensive engine ground run where all power checks, turbo boost checks and fuel system checks were carried out. No abnormal readings or out of limit parameters were found.
201209790	14/08/2012	Take-off	Lamberhurst Farm	Faversham	EGTT : London (FIR)	ROTARY	Reciprocating	1	UK Reportable Accident. Engine failure on take-off at approx 50ft. Attempted to land on runway but sank and impacted ground. One POB, no injuries. Damage sustained. AAIB AARF investigation.	CAA Closure: The gyroplane suffered a loss of engine power soon after lift-off. The pilot arrested the gyroplane's forward speed and made a hard landing at the runway end. The pilot's investigation showed that no electronic fault codes had been registered and that the fuel pumps operated normally and produced the correct pressure. Although the engine idled at the specified rpm in ground runs after the accident, it subsequently idled significantly higher, and the recently fitted throttle position sensor was found to have failed. It was not possible to establish if this was as a result of the accident. The temperature of the day was such that the possibility of fuel vapour lock could not be excluded. AAIB Bulletin 10/2012, Ref: EW/G2012/08/10.
201209801	17/08/2012	En route	London-Heathrow - LHR		EGTT : London (FIR)	BOEING	Turbofan	4	Serious Incident. After take-off, significant vibration noted in airframe. Engine shut down, a/c returned. AAIB Field Investigation.	CAA Closure:□ Significant vibration was noted on the No 2 engine during departure. The engine subsequently failed and was shut down by the crew who elected to jettison fuel and returned. During the approach for a planned autoland, all three autopilots disengaged, the cockpit displays and lights flickered and a series of fault messages were displayed. The resulting electrical failures culminated in a loss of power to one of the electrical AC buses, and many of the systems powered by this bus were lost or degraded. The commander continued the approach, manually flying the aircraft to a safe landing. The investigation determined the flickering cockpit displays and lights resulted from a series of failures within the aircraft electrical system, primarily caused by a latent mechanical failure in a Bus Tie Breaker. The effect of this latent failure only became apparent when the aircraft electrical system automatically reconfigured for the planned autoland. One Safety Recommendation, nr 2014-012 addressed to the aircraft manufacturer. AAIB Bulletin 04/2014, Ref: EW/C2012/08/04.
201209886	19/08/2012	En route	Oxford	10nm North Oxford	EGTT : London (FIR)	CESSNA	Reciprocating	1	D&D Cell Report. A/c declared MAYDAY due to rough runningengine. Given directions to nearest airfield but reportedengine failure and landed in field. No injuries reported.	
201210066	23/08/2012	En route	En Route		EGTT : London (FIR)	BOLKOW	Turboshaft	2	Engine nr2 chip caution illuminated.	Nr2 'MAG PLUG' caution illuminated during flight. Precautionary shutdown of engine nr2 carried out. PAN call made. A/c continued to destination as it was the nearest airfield. A/c shutdown on runway. Mag plugs removed and found to have paste contamination. Plugs cleaned, refitted and a successful engine run carried out. The nr2 engine turbine assembly had been replaced 2FH prior to the indication.
201210175	22/08/2012	En route	En Route	Over River Medway	EGTT : London (FIR)	CESSNA	Reciprocating	1	MAYDAY declared and a/c returned with engine failure.	ATC informed D&D and contacted the airport via landline. The a/c landed safely.

201210256	28/08/2012	En route	Netherthorpe	3nm SW	EGTT : London (FIR)	CESSNA	Reciprocating	1	A/c climbing through 2000ft declared MAYDAY due to total engine failure. A/c safely made a forced landing in a field. No injuries to occupants or damage to a/c.	CAA Closure: □ The investigation found that the carburettor main jet was found blocked by an insect preventing fuel reaching the engine. After cleaning and extensive ground runs, the engine was released to service and the aircraft flown for a 50hr check. Further tests were carried out on the fuel system and all found satisfactory.
201210256	28/08/2012	En route	Netherthorpe	3nm SW	EGTT : London (FIR)	CESSNA	Reciprocating	1	A/c climbing through 2000ft declared MAYDAY due to total engine failure. A/c safely made a forced landing in a field. No injuries to occupants or damage to a/c.	CAA Closure: □ The investigation found that the carburettor main jet was found blocked by an insect preventing fuel reaching the engine. After cleaning and extensive ground runs, the engine was released to service and the aircraft flown for a 50hr check. Further tests were carried out on the fuel system and all found satisfactory.
201210515	03/09/2012	Manoeuvring	En-Route		EGTT : London (FIR)	ZLIN	Reciprocating	1	Engine stopped during spin. Restarted following spin recovery.	Engine idling on ground satisfactory. Engine stopped during 4th turn of a spin to the left. Engine restarted after recovery from spin and increasing airspeed to approx 120kts.
201210829	07/09/2012	En route	Overhead Portsmouth		EGTT : London (FIR)	FLY BUY ULTRALIGHTS	Reciprocating	1	MAYDAY declared due to engine failure. A/c diverted.	Following failure, engine restarted intermittently and a/c diverted. Suspected dirty fuel blocking fuel filter leading to interruption of fuel supply.
201210848	08/09/2012	En route	ROSUN		EGTT : London (FIR)	DE HAVILLAND	Turboprop	2	Overload MACC North/East combined planner position following PAN declared by DHC8 due to engine shutdown. Emergency frequency opened on North solely for the DHC8.	Manchester outbounds were held. Man and boy deployed. Investigation established that the sector was already experiencing a high workload and the unexpected development of the emergency situation increased the workload dramatically. Additionally, there was confusion as to whether or not the emergency a/c, the DHC8 southbound from Newcastle, had been transferred to the correct frequency and was continuing to be in receipt of an ATC service. The Planner's concern for the safety of the DHC8 was heightened by a brief breakdown in efficient and effective sector TRM (Team Resource Management) due to the very high workload. The Planner was also concerned by their inability to provide sufficient support to the Tactical controller. A support controller was employed to bring the sector back under control. □ CAA Closure: Following this incident, additional factors were identified in the investigation process concerning conflicts of interest when watch based staff conduct initial incident investigation, but also hold UCE (Unit Competency Examiner) responsibilities for the controller(s) concerned. Appropriate unit action has been undertaken to address the issues arising from this event and subsequent investigation.
201210986	11/09/2012	Take-off	EGHH (BOH): Bournemouth/ Hurn		EGTT : London (FIR)	DASSAULT	Turbofan	2	PAN declared and aircraft returned following engine malfunction.	A bang was heard along with a winding down noise. The a/c levelled and a nr1 engine surge was diagnosed. Exhaust gas temperature (EGT) was 720deg. The left throttle was switched to idle and single engine flight established. PAN declared and a/c returned with all engine indications normal. After landing the EGT was seen to rise to 640deg. Once stationary there was a light vibration and noise through the airframe therefore the engine was shutdown. A/c taxied back safely with fire services in attendance. Removal of the compressor top has revealed that there has been a stage 8 disc failure around one of the blade tooth slots. This tooth breakout has allowed one of the stage 8 blades to also become detached and also ingested into the engine. The breakout incident has been contained within the engine and damage has only occurred around the stage 8 blades and stator area. The engine is currently being bulk stripped to reveal the full extent of damage rear of the compressor, once known a further update will be provided. □ CAA Closure: □ The disk was inspected and a separate disk post was observed. Laboratory analysis determined that the fracture surface of the disk post to be partially exhibiting heavy oxidation, indicative of a very hot propagation front which is common with high cycle fatigue cracking (HCF). The root cause of the stage 8 disk post separation was cracking initiated and propagated in HCF. The known possible stimuli for the stage 8 disk are reversed stage 7 stator sectors, abnormal stage 8 tip rubs, and stage 7/8 blade mis-assembly. Any of these conditions would introduce abnormal stresses to the stage 8 blade root and disk post areas but none were detected in the hardware or pictures provided to the engine manufacturer or reported by the operator during post event teardown of the engine at their maintenance facility. It is however possible that disk GAT10450 may have experienced one or more of these conditions at some previous point in its service history. The engine workshop recommends that the organisation do the following: 1. Ensure strict adherence to existing cautions in SEI-133 for proper positioning of stator sectors stage 3-7. 2. Ensure strict adherence to maintenance manual requirements for minimum blade tip radial clearances. 3. Ensure strict adherence to maintenance manuals for proper assembly of stage 7 and stage 8 blades in the rotor disks. 4. Ensure strict adherence to SEI-133, TR5-003 and TR72-1253 in performing both visual and MPI inspections for corrosion pitting and SEI-187, 72-00-00 Cleaning and Preservation for performing engine washes and preservation to prevent corrosion. The engine workshop will be reviewing technical manuals to ensure adequate cautions and inspections are in place for reversed stator sectors, blade tip rubs and blade mis-assembly. Additionally it has been advised that no further instances of this nature have occurred on the operator's fleet since. Also at the next opportunity of organisation oversight a review of engine maintenance Stage 7/8 disassembly/assembly be undertaken.
201211357	15/09/2012	En route	EGKA (ESH): Shoreham		EGTT : London (FIR)	BOLKOW	Reciprocating	1	Emergency diversion due to engine malfunction.	Low/no manifold pressure. A/c given joining instructions and landed safely with emergency services in attendance.
201211520	22/09/2012	Approach	Manchester (MCT)		EGTT : London (FIR)	DE HAVILLAND	Turboprop	2	PAN declared due to engine malfunction and subsequent failure on approach.	At approximately 4000ft, a 'thud' was noticed from the rear and the a/c made a slight yaw to the left. This was followed by a smell of smoke in the flight deck. Both bleeds and re-circulation fan were switched off and the smell disappeared. Nr2 engine ITT and oil temperature readings increased, together with a slight decrease in nr2 engine torque. The engine automatically shut down after approximately 10secs following 'Nr2 engine oil pressure' red warning and marked decrease in torque and RPM. A PAN call was made and QRH actioned. Auto pilot was disconnected and the a/c landed safely. Engineers subsequently confirmed that the Fuel Cooled Oil Cooler (FOOC) had sheared from its mounting, resulting in total oil loss. □ CAA Closure: Initial reports from the engine manufacturer suggests that a low pressure compressor nr2 rotor blade failure was the root cause of the event. The blade failure caused substantial damage to the engine core, which subsequently seized. This imbalance is the likely cause of the fuel/oil heat exchanger mounting feet becoming sheared and moving the heat exchanger from its usual installed position. This then exposed the oil transfer tubes (no longer sealed) which resulted in a loss of oil and the subsequent low oil pressure warning. During the engine strip down for investigation, fibrous material was found in various locations within the engine at the front inlet case, low pressure compressor case flange, P2.2 air cavity and low pressure compressor nr2 stator vane. The origin of this material is unknown and final root cause analysis is ongoing.
201211994	27/09/2012	En route	EGBE (CVT): Coventry		EGTT : London (FIR)	DIAMOND	Reciprocating	2	During training flight RH engine 'fuel overtemp' warning received. Fuel temperature showing 140deg. Engine shut down, PAN declared and a/c returned.	A/c had just performed ILS approach with intentional go-around. Fault traced to a faulty temperature sensor.
201212066	29/09/2012	Approach	EGHR (QUG): Chichester/Go odwood		EGTT : London (FIR)	GROB	Reciprocating	1	D&D Cell Report: PAN declared and diversion initiated due to total engine failure. Pilot had lost comms with airfield 3nm short and needed permission to land.	Attempted to contact the airfield but no reply. Pilot made aware and his approach was continued. Communications were lost with the a/c but another a/c in the area confirmed that it had landed safely. Airfield eventually contacted with an alternative number. BGA report received detailing engine malfunction. □ CAA Closure: Information from the BGA showed that due to the time lapse of the incident report the a/c engine had already been removed to effect a repair. Once the engine had been removed and inspection of the damaged parts was carried out, it was clear that a high time engine had been installed into the a/c and that the component was well into the allowed life extension, however, it was judged to be serviceable. It was noted that there was wear in the valve rotor cap and/or collets, causing the rotor cap to migrate higher up the valve stem to a point where it contacted the rocker arm. This contact will have induced rapid wear of the valve collets, leading to failure. The BGA have sent a direct email to all Grob 109B owners with advisory details regarding the Grob G2500 engines and have also reported this to Grob Aerospace. It is anticipated that Grob will revise TM4601-8 to address the advice that during routine valve gear checking or adjustment, the engine should be rotated to fully open the valve and that a check is carried out to ensure that the rocker arm is clear of the rotor cap.
201212266	08/10/2012	En route	EGGP (LPL): Liverpool		EGTT : London (FIR)	AIRBUS	Turbofan	2	MAYDAY declared and a/c returned with nr2 engine shut down.	During climb 'ENG2 REV UNLOCKED' warning occurred. The ECAM drill was completed which required the engine to be shut down with a 'LAND ASAP' amber. MAYDAY was downgraded to a PAN once all drills had been completed and the a/c landed safely. □ CAA Closure: Investigations confirmed that the thrust reverser doors were stowed and locked. It was found that the fault message disappeared when the outboard upper stow switch was disconnected. The switch subsequently failed electrical checks. On closer inspection of the removed switch, the roll pin that keys the switch actuating arm to the switch shaft had migrated free and was missing, allowing the arm to rotate freely. The switch was sent to the OEM for investigation. This was only the third switch to be removed across the fleet in over two years and 12 million switch flight hours and is therefore considered statistically a highly reliable item. Switch replaced and tested satisfactorily.
201212320	09/10/2012	En route	EGBE (CVT): Coventry		EGTT : London (FIR)	DIAMOND	Reciprocating	2	PAN declared and in flight engine shutdown, due to rough running engine and power loss.	The RPM dropped rapidly on the RH engine and the propeller blades were observed to be slowing down. RPM increased and then dropped again, after three times the engine was shut down as a precaution. PAN declared and the aircraft returned. □ CAA Closure: After consultation with the manufacturer, the engine gearbox was found to be unserviceable.
201212614	07/10/2012	En route	Field nr Headcorn	Nr Headcorn Aerodrome	EGTT : London (FIR)	STAMPE	Reciprocating	1	Engine failed possibly due to a fuel problem. A/c force landed in a field. No damage or injuries to two POB.	
201212796	19/10/2012	En route	Craven Arms	Field nearby	EGTT : London (FIR)	BOLKOW	Turboshaft	2	PAN declared and a/c made a precautionary landing in a field following vibration and undemanded oscillation in roll.	During test flight, as nr2 engine was being slowly retarded to test nr1 engine, a pronounced oscillation began in the roll axis which soon became quite a violent action. The movement reduced as nr2 engine lever was returned to flight position. A PAN was declared and pilot decided to land as soon as possible. ATC advised pilot to squawk 7700 and D&D were informed. A/c landed safely without further incident and engineering assistance was requested. The engineer's report stated that a rupture had been found in the compressor bleed valve sealing gasket in nr1 engine. Minor impact damage was found on the rotor and stator blades close to the compressor outer casing. Additionally, a build-up of compacted grass and leaves were found in the compressor diffusers in both engines. □ CAA Closure: □ The aircraft dynamic and flight control systems were examined and check rigged. No defects were identified and no mechanical damage was noted which could account for the lateral oscillations. The No1 engine was examined first and it was found that the compressor bleed valve sealing gasket had ruptured. This would have caused abnormal air flow through the combustion section with possibly compressor surge and/or stall as a result. The compressor outer casings were removed for detailed examination of the rotor and stator stages and there was some minor impact damage evident on the rotor and stator. This has been dressed out. There was also evidence of a build up of compacted vegetable matter (grasses/leaves) in the compressor diffuser which was mechanically removed. No2 engine compressor was split and further similar contamination was found. The compressor bleed valve seal was changed and damage to rotor and stator blades repaired. Compressor diffuser case cleared and cleaned and aircraft returned to service.

201213399	04/11/2012	Take-off	EGKK (LGW): London/Gatwick		EGTT : London (FIR)	ATR	Turboprop	2	MAYDAY declared and emergency landing carried out directly after take-off due to nr2 engine malfunction.	Just after rotation and at 100ft, the a/c began to yaw slightly to the right of track and FD bars commanded a nose down a slight left indication. The engine noise changed and instruments on nr2 engine failed. MAYDAY was declared and ATC gave clearance to turn back for landing. A/c landed safely with emergency services in attendance.☐ CAA Closure: Analysis of DFDR readout by TC holder indicated a suspected uncommanded autofeather and suggested the nr2 engine torque torque sensor was at fault. Sensor replaced with notice given to connector care procedure on harness connecting nr2 engine torque sensor and autofeather unit. Nr2 autofeather unit replaced and strip report awaited.
201213678	09/11/2012	Take-off	EGCC (MAN): Manchester/In tl		EGTT : London (FIR)	AIRBUS	Turbofan	2	A/c in climb, bang heard and felt through airframe. ECAM 'Engine Stall'. Drill followed, engine restored, a/c returned.	CAA Closure: Extensive troubleshooting was carried out law approved data concerning engine surge, stall or turbine overheat and included a full borescope inspection of the engine. In addition, a surge margin test was carried out law RR SB RB211-71-AD509. The engine performed normally in all respects and no defects thought to be the cause of the event were discovered, however it was replaced. Subsequent preliminary assessment by the manufacturer of the HPC blade tip clearance measurements indicated a reduction in surge margin of ~16% to the as-built condition. This is considered high, as recent sampling has shown a reduction of 7%-10% to be more representative of an engine of this on-wing life. More detailed analysis is planned, particularly to assess effect at the flight condition where the surges occurred. By eye, the most significant condition appears to be the length of the HPC stage 6 blades, which are all significantly shorter than the SP50 limit. The variation in the location of the shroud rubs suggests the casing assembly was not uniformly concentric with the rotor. Eccentricity between casing and rotor is likely to have caused heavy blade tip rubs responsible for the short HPC stage 6 blades. No reports have been received from the shop visit regarding any features which could be responsible for eccentricity, wear/binding of the casing assembly location features or interference between the shrouds, vanes and/or the casing rings. The HP/IP handling bleed valves were replaced as a precaution and high power ground runs were carried out, including a surge margin test without faults. The same engine s/n suffered a similar defect eight days later, at which time the engine was removed and a controlled strip investigation was carried out. There were several possible causes for the small reduction in surge margin, but the preliminary conclusion of the OEM as to the root cause is short IPC stage 6 blades. The blade length defect was probably caused by the rotor casing not being concentric with the rotor.
201214006	17/11/2012	En route	En route		EGTT : London (FIR)	AIRBUS	Turbofan	2	MAYDAY declared, fuel dumped and a/c returned for overweight landing, following nr2 engine stall.	Investigations under 201213075 and 201213678.
201214663	04/12/2012	En route	Leavesden		EGTT : London (FIR)	HUGHES	Reciprocating	1	Engine failure and autorotation.	A/c returning to home base at the end of a day flying. Engine oil temperature began to rise and pressure dropped. Power reduced, temperature remained stable but pressure continued to drop below normal operating range. As descent began engine began to rumble then failed, pilot put a/c into autorotation touching down at approx 10kts sliding approx 10metres.☐ CAA Closure: ☐ The cause of the loose sump was considered to be a result of a failure to torque the retaining bolts sufficiently, although with the extended period that has elapsed since this event, it is now not possible to establish this with any certainty. The engine seizure resulted in the need for an extensive overhaul to rectify the internal damage caused. The contracted maintainer was made responsible for the subsequent engine removal and installation of the overhauled powerplant.
201214691	30/11/2012	En route	Near Hollingbourne		EGTT : London (FIR)	DE HAVILLAND	Reciprocating	1	UK Reportable Accident: Engine ran roughly and oil pressure lost. A/c made forced landing in a field. One POB, no injuries. AAIB AARF investigation.	CAA Closure: The a/c was en route to Spanhoe Airfield when the engine suffered a power loss, loss of oil pressure and emitted smoke. The a/c was slightly damaged as a result of the ensuing forced landing. At the time of preparation of the Bulletin, the cause of the engine power loss is unknown, although it is understood that the Nr3 cylinder showed no compression and that a quantity of oil remained in the oil tank. AAIB Bulletin 04/2013, Ref: EW/G2012/11/10.
201214722	06/12/2012	Approach	EGBE (CVT): Coventry		EGTT : London (FIR)	DIAMOND	Reciprocating	2	PAN declared due LH engine in-flight shutdown.	Engine was shut down as a precaution, due to high temperature and low oil pressure warnings. A/c landed safely with emergency services in attendance. Investigation under 201205833.
201214785	07/12/2012	Take-off	EGSD : Great Yarmouth/ North Denes		EGTT : London (FIR)	EUROCOPTER	Turboshaft	2	PAN declared due to engine flame out shortly after take-off.	The a/c had previously diverted due to weather. Prior to flight, snow had been cleared from the fuselage and air intakes. Clearance had already been given by the destination airport, so emergency checklists actioned, engine secured and the a/c landed safely with emergency services in attendance. ATC informed the reporter that the a/c had made a visual approach but the cloud base on the weather report appeared to have been below limits. ☐ CAA Closure:☐ The engine flame out was caused by snow ingestion. Company operating procedures and training has been revised accordingly.
201215041	13/12/2012	En route	EGHH (BOH): Bournemouth/ Hurn		EGTT : London (FIR)	DIAMOND	Reciprocating	2	RH engine shut down following 'Engine Coolant Low Level' and 'High Fluid Temperature' warnings. PAN declared.	On inspection the right cowling showed signs of coolant fluid loss caused by a broken coolant hose.
201215101	15/12/2012	Take-off	EGLC (LCY): London city		EGTT : London (FIR)	BAE	Turbofan	4	PAN declared and a/c diverted following engine failure during level off.	
201215393	22/12/2012	En route	En route		EGTT : London (FIR)	BOEING	Turbofan	2	A/c returned after nr2 engine warning illuminated with an amber caution.	Auto throttle was disconnected and thrust lever retarded to remain within limits. At top of climb, with all engine indications normal, the auto throttle was re-engaged. Maintrol contacted for advice and a/c was required to return for maintenance.
201300263	13/01/2013	En route	En route		EGTT : London (FIR)	AIRBUS	Unknown	2	PAN declared due to nr2 engine failure. Elected to continue to destination.	
201301061	01/02/2013	En route	EGHH (BOH): Bournemouth/ Hurn		EGTT : London (FIR)	BAE	Turboprop	2	Precautionary engine shut down due to oil pressure fluctuation. Single engine approach and landing.	
201301074	02/02/2013	Take-off	EGBJ (GLO): Gloucestershire		EGTT : London (FIR)	PIPER	Reciprocating	1	MAYDAY declared due to rough running engine.	Tower advised all runways clear and then noticed, as a/c approached on a tight base leg, that the landing gear was not down. Pilot was requested to check and on late finals confirmed three greens and the a/c was given clearance and landed safely.
201301078	02/02/2013	Take-off	Crowland Airfield		EGTT : London (FIR)	PIPER	Reciprocating	1	A/c was drifting to the left on take-off run. Engine shut down but a/c wheel left the runway and propeller struck the ground, the tail lifted up and the a/c came to a complete stop.	CAA Closure: The aircraft is club owned and operated for towing gliders. Local investigations confirmed that the incident was pilot induced due to being unable to control the aircraft in a cross wind take-off. There were no technical issues with the aircraft. As a result of the incident (the aircraft tipped up on its nose briefly) the propeller was bent and the engine required "shock load" testing. To enable return to service, the aircraft is being fitted with a new engine and propeller. There was no other significant damage.
201301280	05/02/2013	En route	En route		EGTT : London (FIR)	LOCKHEED	Turboprop	4	Nr1 engine reduction gearbox oil pressure fluctuating. Engine shutdown and a/c returned.	In cruise nr1 engine reduction gearbox oil pressure gauge showed fluctuations accompanied by nr1 low oil pressure light illuminating. Oil contents reducing. Once engine shut down a/c returned due to crosswinds at destination. The investigation found that a human error was the root cause and that the reduction gearbox had not been fitted with an 'O' ring seal. This was due to the mis-identification of the reduction gearbox part number.
201301635	15/02/2013	Take-off	EGGP (LPL): Liverpool		EGTT : London (FIR)	PIPER	Reciprocating	1	UK Reportable Accident: First take-off rejected. During second attempt, engine failed and a/c came to rest, approximately 50m from runway threshold. One POB, no injuries. AAIB AARF investigation.	CAA Closure: The student pilot was preparing to take-off on his first solo flight. The first attempt was abandoned because he felt that the engine power reduced during the take-off roll. On the second attempt, the aircraft became airborne but the engine lost all power at about 300ft. The aircraft force-landed within the airfield perimeter and its nose landing gear collapsed. The instructor commented that he had high regard for his student's flying skills, particularly his handling of the 'engine failure after takeoff' drill. His only regret was that, had he known the reason for aborting the first take-off, he would have instructed the student to abandon the sortie. He states that his organisation has reiterated to all pilots flying with them that they must cancel their flight and return should any problems be experienced prior to take-off. At the time of the Bulletin, no reason for the engine failure has been established. AAIB Bulletin 06/2013, Ref: EW/G2013/02/06.
201302193	17/02/2013	Take-off	Top Farm	Roystone	EGTT : London (FIR)	ROCKWELL	Reciprocating	1	Propeller strike.	On take-off on soft ground, a/c accelerated and throttle then retarded. A/c veered to the left and the engine stopped causing the propeller to strike the ground at slow speed. Damage to engine and propeller.
201302239	03/03/2013	En route	EGNC (CAX): Carlisle	8W	EGTT : London (FIR)	PIPER	Reciprocating	1	Partial loss of engine power. PAN declared and a/c returned.	Loud bang heard followed by vibration and a power loss of approx 400rpm. Investigation revealed nr1 cylinder had cracked from the lower spark plug.
201302461	08/03/2013	Take-off	EGHI (SOU): Southampton		EGTT : London (FIR)	DE HAVILLAND	Turboprop	2	Fumes in the flight deck. Oily smell from air conditioning.	Passing 100ft a strong oily smell entered the flight deck through the air conditioning. It disappeared passing approx 5000ft so the decision was made to continue the flight. The smell appeared again at top of descent at FL140 and had faded by FL100. No reports from cabin crew. Flight crew were concerned as a similar occurrence on the previous sector had caused crew to suffer headaches. ☐ CAA Closure: Engine was removed and strip report found that the carbon element of the nr5 front carbon seal was turning inside the carbon seal housing. As a consequence, oil could seep through the seal housing. The engine manufacturer is investigating the nr5 carbon seal wear leading to contamination issues.

201302644	02/03/2013	Take-off	EGHJ (BBP): Bembridge		EGTT : London (FIR)	GRUMMAN	Reciprocating	1	Carburettor heat failure on departure and rough running engine. A/c returned.	During pre take-off engine checks the carburettor heat appeared to be functioning normally, however with a slightly smaller drop in RPM than usual. Once airborne the a/c had a reduced climb rate and the engine could be felt to be running rough. Once at approx 500ft the pilot operated the carburettor heat but no RPM drop was observed. At this point the pilot elected to return. Inspection revealed that the carburettor heat's operating arm had sheared off and left the heater partially on. Manufacturer is aware of the fault and is sending a replacement improved shaft.
201302682	09/03/2013	En route	EGCN : DONCASTER SHEFFIELD		EGTT : London (FIR)	CESSNA	Unknown	2	PAN declared and a/c diverted due rough running engine.	
201303545	20/03/2013	Take-off	EGNE : Repton/Gamston		EGTT : London (FIR)	DIAMOND	Turboprop	2	PAN declared and a/c diverted due to unsafe LH main gear indication.	Pilot requested diversion due to no green undercarriage lights then declared that he would be shutting down LH engine on approach. A/c landed safely with emergency services in attendance.
201303578	06/04/2013	Approach	EGCC (MAN): Manchester/Intl		EGTT : London (FIR)	BOEING	Turbofan	2	Unable to move RH thrust lever below 1.5EPR.	A/c diverted and a single engine landing performed law SOPs. CAA Closure: Investigations found that the RH engine power cable was binding within the lower control box. Excessive swarf was found within the fuel flow governor (FFG) box assembly, caused by a 'bird caged' teleflex cable. The lower control box was sent to the OEM for investigation. The subject unit has a recommended soft life of 7500fh (at any shop visit) which results in an overhaul at each shop visit to ensure no problems are encountered with the part. The unit was installed to engine at birth in Feb 2000 and the first Shop visit was on 10 May 2008 at 20558fh and 7732cyc. During this shop visit the unit was overhauled and re-installed. This unit has now accumulated 12879fh and 4230 cyc since overhaul. The OEM subsequently stated that in their experience nothing unusual was found and the findings are in line with general wear and tear. A review of fleet records has not identified a previous occurrence of this type to this component.
201303867	13/04/2013	En route	En route	7nm N EGSS	EGTT : London (FIR)	BEECH	Turboprop	2	Engine failure and diversion.	Due to low traffic levels a/c given shortcut towards destination. Shortly after advising that there was 'trouble' with one of the engines the pilot advised that one of the engines had shut down. A/c advised that it was diverting to an airfield closest to his position. A/c appeared to be single crewed and handling a very high workload.
201303975	15/04/2013	Take-off	EGVN (BZZ): Brize norton		EGTT : London (FIR)	ANTONOV	Turbofan	4	A/c returned due to a surge indication on nr4 engine. Engine shut down and a/c landed safely on three engines. Foreign Authority investigation.	
201304193	20/04/2013	Take-off	EGCV : Sleep		EGTT : London (FIR)	CESSNA	Reciprocating	1	Engine malfunction, PAN declared and a/c returned.	At approx 700ft in climb out engine began to misfire and run rough for approx 2sec. This occurred in short bursts for an increasing duration. Due to uncertainty of the engine maintaining power, a/c returned having declared a PAN. A/c landed without further incident.
201304212	21/04/2013	En route	Inside EGLC CTR		EGTT : London (FIR)	PIPER	Reciprocating	1	A/c reported rough running engine, PAN declared and a/c requested diversion to nearest airfield.	En-route to diversion a/c reported engine now running satisfactorily. PAN cancelled, a/c continued to diversion airfield as a precaution for a landing without further incident.
201304374	24/04/2013	En route	EGLL (LHR): London/Heath row		EGTT : London (FIR)	AIRBUS	Turbofan	2	PAN declared due to nr2 engine control issues.	High engine idle and unresponsive engine. QRH actioned and nr2 engine shut down in flight. A/c landed without incident with emergency services in attendance. Taxied to stand under own power. CAA Closure: Root cause could not be determined due to elapsed time and change of operator. The occurrence was reported by the previous operator of the aircraft and the current operator does not have the work package which was generated during the investigation. Engine changed.
201304582	29/04/2013	En route	SITET VOR	47nm SSE EGKA (Shoreham)	EGTT : London (FIR)	PIPER	Reciprocating	1	PAN declared due to rough running engine. Aircraft was diverted.	The pilot stated he had engine problems and was making a turn back to LFOH. The pilot then declared a PAN. The aircraft was asked to squawk 7700 and radio silence was imposed. LFRG and D&D were informed of the situation. A few mins later the aircraft changed squawked to 7600, the controller then lost contact. LFRG reported that they had cleared the way for the aircraft to land at LFOH. At 1514 LFOH confirmed that they had the aircraft on frequency and subsequently that he had landed safely.
201304855	03/05/2013	En route	Ercal Heath	Market Drayton	EGTT : London (FIR)	OTHER	Reciprocating	1	A/c declared MAYDAY just outside Shawbury Zone with engine failure at 1300ft. A/c landed in a field, approx 6nm east of Shawbury.	D&D reported that the pilot had contacted local police and reported there were no injuries and the a/c was undamaged.
201305180	10/05/2013	Approach	EGBJ (GLO): Gloucestershire		EGTT : London (FIR)	EUROCOPTER	Turboshaft	2	Nr2 engine overspeed.	During approach with simulated nr2 FADEC failure the student failed to apply power to the engine with 'Failed' FADEC by correct use of the twist grip. The examiner applied throttle as aircraft landing but inadvertently caused the nr2 engine to shutdown due to overspeed.
201305274	13/05/2013	En route	EGBJ (GLO): Gloucestershire		EGTT : London (FIR)	STEARMAN	Reciprocating	1	MAYDAY declared and forced landing made due to engine failure.	Controller received the MAYDAY call and despatched a fire vehicle and a departing a/c towards the area. The a/c was located and reported safe. Civil emergency services were directed to the scene. Subsequent investigation revealed dropped inlet valve on nr9 cylinder causing power loss.
201305463	13/05/2013	Take-off	EGNV (MME): TEESSIDE		EGTT : London (FIR)	DIAMOND	Reciprocating	2	Rejected take-off due to engine power limitations. One engine was producing approx 40% power on full throttle.	A download of the engine ECU showed a boost pressure problem. Data download copied to engine manufacturer. On investigation the control rod from the waste gate controller to the valve was found broken.
201305509	06/05/2013	En route	En route	5nm W EGBE	EGTT : London (FIR)	GROB	Reciprocating	1	PAN declared due to engine shut down. Aircraft returned.	Aircraft reported engine problem en route and intention to return. Aircraft then reported engine shut down and declared PAN. Aircraft followed by fire services on landing.
201305817	21/05/2013	En route	en route		EGTT : London (FIR)	CIRRUS	Reciprocating	1	Reported engine technical problems. Aircraft diverted. ATC declared a full emergency.	
201305898	24/05/2013	Take-off	EGLL (LHR): London/Heath row		EGTT : London (FIR)	AIRBUS	Turbofan	2	UK Reportable Accident: On departure, engine cowlings fell onto runway. One engine shut down and a/c returned. Passengers evacuated via emergency slides. 80 POB, no injuries. A/c damage to be advised. AAIB Field investigation.	Initial AAIB investigations (Special Bulletin S3/2013) found that the fan cowl doors from both engines detached as the a/c departed the runway during take-off. This punctured a fuel pipe on the RH engine and damaged the airframe and some systems. The crew elected to return and on the approach to land an external fire developed on the RH engine. The LH engine continued to perform normally throughout the flight. The RH engine was shut down and the a/c landed safely and was brought to a stop on the runway. The emergency services quickly attended and extinguished the fire in the RH engine and the passengers and crew evacuated the a/c via the escape slides without injury.
201306058	18/05/2013	Take-off	EGTB : Wycombe Air Park/Booker		EGTT : London (FIR)	PIPER	Reciprocating	1	UK Reportable Accident: A/c suffered engine failure after take-off and landed in a field. One POB, no injuries. AAIB AARF investigation.	CAA Closure: Shortly after take-off, at a height of about 50ft, there was a sudden vibration, which was severe enough to prevent the pilot reading his instruments. The vibration then stopped, combined with a complete loss of engine power. The pilot jettisoned his glider and manoeuvred the aircraft for a forced landing in fields beyond the airfield boundary. The aircraft ran into a hedge and pitched nose-down, flipping over onto its back and coming to rest inverted. The pilot, who was wearing a full harness, was uninjured and was able to vacate through the aircraft's door. At the time of the report, the reason for the engine failure was awaited. AAIB Bulletin 08/2013, Ref: EW/G2013/05/15.
201306211	29/05/2013	En route	EGTE (EXT): Exeter		EGTT : London (FIR)	BEECH	Reciprocating	2	MAYDAY declared due to RH engine failure.	The aircraft reported being unable to maintained height in the circuit so was told to join RH base for R/W08. The aircraft landed safely.
201306487	05/06/2013	Take-off	EGTC : Cranfield		EGTT : London (FIR)	PIPER	Reciprocating	1	UK Reportable Accident: During a touch-and-go landing, the engine began to run roughly. The engine subsequently failed and control of the aircraft was lost. Two POB, both serious injuries. AAIB Field investigation.	CAA Closure: During the climb following a touch-and-go landing, the engine began to run roughly. A turn was commenced during which the engine failed and control of the aircraft was lost. The aircraft crashed within the aerodrome boundary. The damage to the aircraft and the ground marks were consistent with the aircraft stalling and dropping the left wing at a relatively low height while close to the threshold of Runway 21. Evidence from examination of the wreckage indicated that the engine was producing little or no power at impact. Subject aircraft was one of a number of aircraft owned and operated by the flying school and flown on a Certificate of Airworthiness (C of A) issued by the CAA. Safe operation of aircraft, and the validity of a C of A, is dependent on an aircraft being maintained in an airworthy condition. This requires an aircraft to be operated on an approved fuel, maintained at the intervals specified in its maintenance programme, and for work to be correctly documented and carried out by qualified individuals. This investigation discovered that two of the flying school's aircraft operated on fuel that is not approved by the CAA. With regard to the subject aircraft, it appeared that flying hours, defects and rectification had not been recorded in the log books and technical records, and an individual carried out maintenance on the subject aircraft, who did not hold the required approvals. In the absence of evidence of alternative causes, carburettor icing appears to be the most likely cause of the rough running. AAIB Bulletin 03/2014, Ref: EW/C2013/06/01.
201306821	09/06/2013	Take-off	EGGP (LPL): Liverpool		EGTT : London (FIR)	PIPER	Reciprocating	1	PAN declared due to misfiring engine. A/c returned.	Departing a/c reported engine misfiring. PAN declared and a/c returned. Engine stalled on runway but re-started and taxied to parking area. Investigation found that two spark plugs had lead fouled electrodes and the RH magneto was found to be intermittent. The magneto and spark plugs were replaced with serviceable parts and engine ground runs carried out. Air test found satisfactory.
201306983	16/06/2013	Approach	Benston Farm	2nm south of Cumnock	EGTT : London (FIR)	ZENAIR	Reciprocating	1	UK Reportable Accident: Engine failed, landed short of landing strip. Two POB, no injuries.	CAA Closure: AAIB downgrade to 'Non-Reportable' from AARF investigation. No further investigation to be progressed by the AAIB.

201307441	24/06/2013	Take-off	EGCC (MAN): Manchester/In tl		EGTT : London (FIR)	AIRBUS	Turbofan	2	Serious Incident: Rejected take-off due to RH engine failure. AAIB AARF investigation.	CAA Closure: At approximately 105 kt on a takeoff roll, the right engine failed, emitting a flash and smoke from the exhaust. The crew quickly established that there was a loss of power and aborted the takeoff, brought the aircraft to an emergency stop on the runway and taxied clear using the unaffected left engine. Inspection of the right engine revealed there had been a failure of a single HP turbine blade which had detached, resulting in a high power engine surge and further secondary damage to the IP and LP turbines and nozzles. The blade failure was caused by high cycle fatigue (HCF) crack propagation with crack initiation resulting from 'Type 2 Sulphidation' corrosion1. During examination of the remains of the blade, to determine the cause of its failure, unidentified deposits were found on its surfaces. There was concern that these deposits may have been volcanic in origin, in particular from the 2010 eruption of Eyjafjallajökull in Iceland, so additional forensic analysis was carried out. That work was completed in August 2014 and did not identify compounds typically associated with volcanic activity. However, although an encounter with volcanic gaseous sulphur cannot be discounted it is concluded that the deposits probably are an accumulation of atmospheric dirt and pollutants.AAIB Bulletin 12/2013, Ref: EW/G2013/06/21.
201307526	25/06/2013	En route	EGLC (LCY): London city		EGTT : London (FIR)	CESSNA	Turbofan	2	MAYDAY declared due to precautionary engine shutdown.	Pilot shut down one engine due to low oil pressure and was diverted. The aircraft landed safely.
201307556	26/06/2013	En route	EGLL (LHR): London/Heath row		EGTT : London (FIR)	BOEING	Turbofan	4	Rejected take-off due engine failure indication on nr1 engine.	After take-off thrust selected immediate exceedance of 108% N2 indicated on nr1 engine. As engines stabilised EPR showed 1.28 N1 around 71% low fuel flow. Rejected take-off at 67kts. Aircraft stopped on runway. Engine fire checklist carried out. Brake temperatures low so taxied clear of runway for fire services inspection before taxi to stand. Engineering inspection found the LH ram muscle tubes to be loose, although they were wire-locked. The variable inlet guide vane controller and centrisep filters replaced as a precaution and RH ram muscle tubes inspected for security. Engine ground runs carried out, all satisfactory.
201307791	30/06/2013	Take-off	EGMD (LYX): Lydd		EGTT : London (FIR)	PIPER	Reciprocating	2	Precautionary engine shutdown due to rough running engine. Aircraft returned.	Power surges and violent vibrations felt shortly after setting climb power. Pilot elected to shutdown nr1 engine and requested immediate return. Investigation under 201305606.
201308230	06/07/2013	En route	En route		EGTT : London (FIR)	SOCATA	Reciprocating	1	PAN declared due to rough running engine. Aircraft landed safely.	
201308250	08/07/2013	Take-off	EGHH (BOH): Bournemouth/Hurn		EGTT : London (FIR)	DIAMOND	Reciprocating	2	LH engine shut down due to coolant low warning/high temperature warning.	Upon initial climb out, 'Coolant Low' caution on the LH engine activated followed by a 'High Temperature' warning. LH engine was shut down as a precautionary measure. Uneventful landing. Jubilee clip on coolant pipe found to have failed. Clip replaced.
201308342	11/07/2013	En route	Overhead EGGP	Liverpool	EGTT : London (FIR)	BEECH	Reciprocating	1	Rough running engine. PAN declared. Aircraft diverted.	Aircraft in descent to overfly airfield when PAN declared due to engine noise and performance. Aircraft diverted for nearest suitable site for landing.
201308456	13/07/2013	En route	EGLL (LHR): London/Heath row		EGTT : London (FIR)	BOEING	Turbofan	2	MAYDAY declared due to engine malfunction. Aircraft diverted.	One engine running at idle only. Aircraft diverted for engineering assistance.
201308612	13/07/2013	En route	EGMD (LYX): Lydd		EGTT : London (FIR)	DE HAVILLAND	Reciprocating	1	Aircraft diverted due to rough running engine.	Aircraft landed without establishing two way radio communication. Following a safe landing pilot reported rough running engine with cockpit workload preventing making radio contact.
201308799	18/07/2013	Take-off	EGDG (NOY): St. Mawgan		EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	2	Nr1 engine chip light illuminated and spurious engine fire warning.	Aircraft on airtest to check nr1 engine following module change and to check rotor track and balance. Passing 300ft at 80kts nr1 engine chip light illuminated. PAN declared and engine shut down and aircraft returned. During taxi nr1 engine fire warning illuminated. Engineer disembarked to check that there were no other signs of fire.
201308985	16/07/2013	En route	EGNS (IOM): Isle Of Man/Ronalds way	8nm from EGNS	EGTT : London (FIR)	COMCO IKARUS	Reciprocating	1	PAN declared due to engine problems. Aircraft diverted.	
201309073	20/07/2013	Take-off	EGKA (ESH): Shoreham		EGTT : London (FIR)	DIAMOND	Reciprocating	2	Engine failure during climb. PAN declared.	During climb at 700ft a noise was heard from the LH engine and ATC reported observing smoke from the same engine. As instructor took control of the aircraft a flame was seen for a brief period followed by dark black smoke. LH engine shut down, PAN declared and aircraft made a normal single engine landing with fire services in attendance.
201309946	06/08/2013	Approach	EGBW : Wellesbourne mountford		EGTT : London (FIR)	VANS	Reciprocating	1	UK Reportable Accident: Engine failure. Aircraft inverted after making a forced landing in a field. One POB, minor injuries. AAIB AARF investigation.	CAA Closure:☐ The aircraft was flying circuits but on the downwind leg of the second circuit the engine stopped and appeared to windmill. The pilot turned the aircraft into wind and selected a field for a forced landing. Unfortunately, the aircraft overran and struck a fence, hedge and small trees, tipping onto its nose and coming to rest in a vertical, nose-down attitude. Two anomalies were subsequently found which could have caused the engine to fail. Contaminated fuel was drained from the filter bowl and three of the four bolts which secured a timing gear to the crankshaft were found to have failed and exhibited extensive high cycle fatigue. It could not be confirmed which mechanism had caused the failure. AAIB Bulletin 04/2014, Ref: EW/G2013/08/02.
201310060	09/08/2013	En route	EGNX (EMA): NOTTINGHAM EAST MIDLANDS		EGTT : London (FIR)	BAE	Turboprop	2	En route engine failure.	RH engine developed erratic torque indication in cruise with subsequent noise to match. Indications also seen to NH/NL and NP. As indications worsened therefore decision taken to shut engine down. PAN declared and single engine landing made with fire services in attendance. Engine Electronic Control (EEC) Unit changed.
201310184	09/08/2013	Take-off	Two Ash Farm		EGTT : London (FIR)	CYCLONE AIRSPORTS	Reciprocating	1	UK Reportable Accident: Power loss after take-off. During forced landing, aircraft stalled and nose dropped. Aircraft hit the ground, collapsing the NLG. Two POB, one minor injuries. AAIB AARF investigation.	CAA Closure:☐ After takeoff, at a height of about 300 ft, the pilot sensed the engine rpm drop to around 4,000 to 4,500 from its normal maximum rpm of about 6,500. This was insufficient to maintain level flight and so the pilot turned into wind and chose a suitable field. As he approached the field, he realised that he was very close to a hedge which bordered it, so he tried to turn to the right to land parallel to the hedge. The aircraft stalled at a height of about 10 ft and the nose dropped to the left, hitting the ground and collapsing the nose landing gear. The pilot acknowledged that, in addition to the unfortunate timing of the engine power loss, he had allowed the aircraft to become slow, and he could have chosen a more suitable field to land in. Although he intends to do a thorough investigation of the engine and fuel system, at the time of preparation of this bulletin no obvious reason for the power reduction had been found. AAIB Bulletin 01/2014, Ref: EW/G2013/08/07
201310320	14/08/2013	En route	Pilling	2nm SW of Cockerham	EGTT : London (FIR)	CESSNA	Reciprocating	1	Forced landing due to rough running engine.	Pilot informed ATC no injuries sustained. No details of damage to aircraft.
201310629	21/08/2013	Approach	Wymeswold	Common Farm	EGTT : London (FIR)	EUROPA	Reciprocating	1	UK Reportable Accident: Aircraft wreckage located in field close to farm strip. Two POB, both fatally injured. AAIB Field investigation.	CAA Closure:☐ The evidence suggests that the pilot had abandoned the planned flight and was flying a low-level circuit to land back on the airstrip, probably as a result of an engine problem. The aircraft was at a low height and close to the runway during the downwind leg. The airspeed decreased during the turn onto the base leg, probably resulting in a stall and subsequent loss of control. There was insufficient height to effect a recovery and the aircraft impacted the ground in a steep nose-down attitude, causing fatal injuries to both occupants. AAIB Bulletin 08/2014, Ref: EW/C2013/08/02.
201312033	02/09/2013	Manoeuvring	EGDX : St. Athan		EGTT : London (FIR)	GROB	Reciprocating	1	Rapid RPM decay and propeller stopped during aerobatic stall turn.	The aircraft was 45deg nose up when the propeller stopped. After recovering from the vertical, the engine restarted at approx 105kts. Aircraft returned and engineers informed. This flight was undertaken as a part of the return to service of the fleet following replacement of the propeller and governor, also of the oil pressure relief spring and inverted oil valve. All work was in connection with a previous RPM drop off fault during manoeuvres. It has been confirmed that the oil cooler blank was found still fitted, leading to a higher than normal oil temperature, this could have been a contributory factor to this event.
201312035	02/09/2013	Manoeuvring	EGDX : St. Athan		EGTT : London (FIR)	GROB	Reciprocating	1	RPM decayed and the propeller stopped during aerobatic stall turn.	After recovering from the vertical, the engine restarted at approx 105kts. Aircraft returned and engineers informed. This flight was undertaken as a part of the return to service of the fleet following replacement of the propeller and governor, also of the oil pressure relief spring and inverted oil valve. All work was in connection with a previous RPM drop off fault during manoeuvres. It has been confirmed that the oil cooler blank was found still fitted, leading to a higher than normal oil temperature, this could have been a contributory factor to this event.
201312042	20/09/2013	En route	EGKA (ESH): Shoreham		EGTT : London (FIR)	DE HAVILLAND	Reciprocating	1	MAYDAY declared due to severely rough running engine. Aircraft made a forced landing in a field.	Aircraft was cleared to land with all runways available but began circling ATCO informed him of a farm strip in the vicinity but the pilot reported not visual and going for a field. Two helicopters were diverted to find and report on position, both helicopter pilots reported watching the aircraft carry out a safe landing in a field.☐ CAA Closure:☐ The TC holder for the a/c type contacted the operator, who stated that engineers diagnosed a stuck valve. The fault was rectified and the aircraft flown out of the field. There are various configuration issues with the engine exhaust valves and cylinder heads which are to be discussed jointly between the CAA and the engine TC holder.
201312071	20/09/2013	En route	EGTF : Fair Oaks		EGTT : London (FIR)	CESSNA	Reciprocating	1	PAN declared due rough running engine.	Aircraft declared a PAN with a rough running engine. ATC granted permission for aircraft to climb in Heathrow zone to gain height in the event of an engine failure. Aircraft executed a go-around.
201312221	25/09/2013	En route	EGKK (LGW): London/Gatwick		EGTT : London (FIR)	BOEING	Turbofan	2	MAYDAY declared and diversion requested following loss of nr2 engine.	Aircraft landed under a full emergency and on arrival the flight crew reported hitting an unknown bird type. However, it is unclear from the reports whether or not this was the cause of the engine shutdown. Runway inspection carried out, no bird remains found.

201312734	05/10/2013	En route	Overhead Lundy Island		EGTT : London (FIR)	BELLANCA	Reciprocating	1	Rough running engine.	Aircraft overflying Lundy Island called a PAN due to rough running engine.
201312863	04/10/2013	En route	Upper Edgebold		EGTT : London (FIR)	BELL	Turboshaft	1	UK Reportable Accident: Engine failure. During the ensuing forced landing the helicopter rolled over, coming to rest on its side. One POB, minor injuries. AAIB Field investigation.	CAA Closure:☐ The pilot noticed that the engine turbine temperature had increased to close to its maximum limit and prepared to make a precautionary landing. During the approach the indication returned to normal, so he decided to continue the short distance to his destination. As the helicopter climbed away, the engine failed. The pilot carried out a forced landing during which the tail boom struck the ground. He candidly commented that, on reflection, it would have been better to continue with the precautionary landing, rather than having to attempt a forced landing without power from low altitude. He added that in the final stages of the approach he probably flared too much, causing the tail boom to strike the ground. The engine failure appears to be as a result of the disintegration of the No 7 bearing, which was most likely caused by oil starvation. This bearing supports part of the turbine assembly and therefore relies on oil flow for cooling, as well as lubrication. Any reduction in oil flow could lead to the bearing overheating and ultimately failing. AAIB Bulletin 07/2014, Ref: EW/C2013/10/02.
201313141	14/10/2013	En route	EGNX (EMA): NOTTINGHAM EAST MIDLANDS		EGTT : London (FIR)	CESSNA	Reciprocating	2	Engine vibrations resulting in engine shutdown and single engine landing. Aircraft returned.	Moderate airframe vibrations felt. Nr1 engine identified as likely cause. Informed ATC of decision to return. At 7000ft airframe vibrations and engine behaviour worsened, elected to level at 7000ft to perform engine shutdown. No emergency declared. Emergency services attended.
201313150	20/06/2013	Manoeuvring	EGYD : Cranwell		EGTT : London (FIR)	GROB	Reciprocating	1	RPM ran down and propeller stopped during a stall turn.	During vertical roll, the RPM decayed rapidly and during the push over, the propeller stopped. This occurred on each of three test flights and is the subject of an ongoing company investigation. Investigation under 201305032 (different aircraft).
201313155	09/07/2013	Manoeuvring	EGYE : Barkston heath		EGTT : London (FIR)	GROB	Reciprocating	1	Propeller stopped during aerobatics.	Whilst carrying out various aerobatic manoeuvres, with full power, mixture best power, max RPM, the engine wound down when the oil pressure dropped and stopped completely halfway through a stall turn. The manoeuvre was flown slightly past the vertical. Mixture rise at shutdown was 100rpm. Two way oil valve removed, tested and refitted. All figures within limits, valve fit for further service iaw AMM. Engine cylinder compressions checked, engine ignition timing checked and both magneto set to 25deg. Fuel injector nozzles removed, cleaned and refitted. Further investigation continues with the OEM.
201313157	24/09/2013	Manoeuvring	EGYD : Cranwell		EGTT : London (FIR)	GROB	Reciprocating	1	Propeller stopped during a RH spin as part of the flight check.	Further investigation continues.
201313164	30/08/2013	Manoeuvring	EGYE : Barkston heath		EGTT : London (FIR)	GROB	Reciprocating	1	Engine stopped during aerobatics.	Whilst carrying out aerobatic manoeuvres as part of the flight check schedule a noddy stall turn was executed. During the second nod (to the right), the RPM started to wind down rapidly. Speed decayed rapidly and the propeller stopped whilst the aircraft was pointing vertically up. Once recovered from the vertical and speed increased, with throttle closed, the engine started. Engineers informed and further investigations continue.
201313168	26/06/2013	Manoeuvring	EGDY (YEO): Yeovilton		EGTT : London (FIR)	GROB	Reciprocating	1	RPM ran down and engine stopped.	During a flight check to check serviceability of the modified oil system it was noted that RPM run downs of 5-700rpm were possible during zero G aerobatic manoeuvres. The aircraft was placed unserviceable in order for maintenance to be carried out. On a subsequent check flight (this sortie) to monitor oil pressure and rpm a slight reduction was observed in rpm but this time within acceptable limits. However during the spin both to the left and the right, significant run downs were noted and in the spin to the right complete stoppage of the engine occurred. At 120kts the propeller wind milled and restarted with no other input from the handling pilot. Engine indications were normal and the aircraft recovered. Mixture rise during shutdown was noted to be a little high. Aircraft unserviceable. Engine ground runs carried out. Aircraft released to service for a further Company flight check iaw AS 159. The aircraft has flown for 75:50 hours without recurrence of the reported incident.
201313249	02/10/2013	Manoeuvring	EGDY (YEO): Yeovilton		EGTT : London (FIR)	GROB	Reciprocating	1	Propeller stopped during aerobatics.	During aerobatic sequence a stall turn right was attempted. As the nose went forward before passing the horizontal the propeller slowed rapidly and stopped. In the subsequent dive the propeller started to slowly rotate, RPM then increased to 2700rpm , when in level flight the engine temperatures and pressures were observed to be in normal range. The following day aircraft was conducting a spin when again the propeller slowed and stopped. Further investigations continue.
201313331	06/10/2013	En route	En route		EGTT : London (FIR)	PIPER	Reciprocating	1	MAYDAY declared due to engine malfunction. Aircraft diverted.	En-route a rapid decline was seen in engine rpm from 2400 to 2000rpm. This was accompanied by an unusual engine noise. Initial impression was that carburettor icing was the cause, carburettor heating had already been used for the initial stages of the flight, no improvement was seen with the application of carburettor heating. After changing fuel tanks, checking temperature and pressure gauges to ensure correct operation and settings a MAYDAY call was made to local ATC advising of the intention to divert to the nearest available airfield. The aircraft continued to maintain 2000rpm and a successful landing was made. After landing it was discovered that one of the cylinders was cracked resulting in no compression in that cylinder.
201313370	12/10/2013	Approach	EGNG : BAGBY		EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	2	Single engine landing carried out following nr2 engine malfunction.	During the approach, nr2 engine oil pressure light illuminated and torque on the engine dropped to zero. Pilot established a safe single engine speed and continued the approach. As short finals approached, it was noticed that the nr2 engine temperature had exceeded 950degC. Engine shut down iaw Flight Manual and the aircraft landed with the fuel level noted to be at 15%. Engineering investigation in progress.
201313378	17/10/2013	Approach	EGNR : Hawarden		EGTT : London (FIR)	PIPER	Reciprocating	1	Engine vibration.	Investigation revealed nr1 cylinder inlet push rod failure. Engine has high hours therefore no further investigation intended.
201313441	20/10/2013	En route	EGBE (CVT): Coventry		EGTT : London (FIR)	SOCATA	Reciprocating	1	MAYDAY declared and aircraft diverted due to engine problems/failure.	
201313539	19/10/2013	Take-off	EGBB (BHX): Birmingham		EGTT : London (FIR)	AIRBUS	Turbofan	2	Engine failure on application of take-off power.	On setting 50% N1 for take-off nr2 engine ran down to idle combined with ECAM 'Eng 2 fail'. Take-off rejected at low speed approx 15kts and aircraft returned to stand. Reporter notes that nr2 engine had recently had an ECU changed.
201313911	29/10/2013	En route	EGTE (EXT): Exeter	30nm West EGTE	EGTT : London (FIR)	DE HAVILLAND	Turboprop	2	MAYDAY declared due to engine 'Fire' warning.	Fire alarm was heard shortly after reaching top of descent after passing through a moderate rain shower and turbulence into clear air. LH fire warning handle was observed as illuminated but no fire observed. Emergency procedure was carried out as per checklist and engine was secured. MAYDAY call was made. Single engine landing was carried out with fire crew in attendance. Aircraft not damaged and no injuries.☐ CAA Closure:☐ The event was caused by insufficient moisture protection on the LH fire detector probe connector. The part is an alternate to that fitted on the RHS. Although this part is also sourced via the TC Holder, it does not have the same level of moisture protection. A vendor Service Bulletin is available to improve moisture protection and prevent ingress, however, this information was not made available to the operator and it is unclear if the TC Holder has taken action to advise other customers ordering this part that this vendor SB is applicable. The TCH has been made aware of the situation and has been requested to review data relating to other incidents involving this type of probe.
201314230	05/11/2013	Take-off	EGCC (MAN): Manchester/Int'l		EGTT : London (FIR)	ATR	Turboprop	2	MAYDAY declared due engine failure. Aircraft diverted.	Aircraft reported engine failure after take-off and being unable to climb. Upon landing the pilot reported brake problems and requested fire services inspection of undercarriage to check for overheated brakes and a suspected burst tyre. Aircraft stopped on runway and engines shutdown in order for brakes to be inspected. AAIB informed.
201314826	17/11/2013	En route	EGNH (BLK): Blackpool		EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	1	Aircraft diverted due to weather. PAN declared and one engine shut down due to critical fuel level.	CAA Closure:☐ Aircraft ran out fuel through poor lack of judgement of pilot in command. Appropriate action taken by company.
201314886	19/11/2013	En route	Overhead EGGW (LTN): London/Luton		EGTT : London (FIR)	PIPER	Reciprocating	2	Left engine suffered a major mechanical failure. Aircraft diverted and an emergency landing completed. Two POB, no injuries. AAIB AARF investigation.	CAA Closure:☐ During cruise at FL80, the left engine suffered a mechanical failure. The crew shut down the engine and feathered the propeller but were unable to maintain altitude. An emergency landing was completed without further incident. Inspection found the No.2 cylinder assembly of the left engine had detached from the crankcase due to an internal failure. At the time of writing a detailed examination of the engine had not taken place, so it is not possible to draw any firm conclusions as to the cause of the failure. AAIB Bulletin 06/2014, Ref: EW/G2013/11/04.
201315279	25/11/2013	Approach	EGBJ (GLO): Gloucestershire		EGTT : London (FIR)	BEECH	Reciprocating	2	Precautionary engine shut down due to oil loss.	The pilot reported inbound with one engine shut down as a precautionary measure due to oil loss. The pilot did not declare an emergency, however full emergency action was initiated. A straight in approach to R/W09 was coordinated with ADC and a safe landing was effected. Emergency services were stood down as the aircraft taxied back to the apron.

201315555	26/11/2013	En route	EGWU (NHT): Northolt	N54 48 56.8 W001 26 06.9	EGTT : London (FIR)	PIPER	Reciprocating	2	Loss of oil pressure on RH engine.	Aircraft returning from survey task. A significant mismatch between LH and RH Manifold Air Pressure (MAP) RH engine steady at 20" which was 12" less than LH which was indicating as expected. Decision made to divert for engineering assistance. After approx 5mins the MAP on the RH engine returned to normal without any movement of throttles. The oil pressure on the RH engine began to fall and stabilised in the amber range. Once the aircraft had landed the ERH oil pressure indicated just above zero therefore the engine was shut down and aircraft taxied to stand on single engine. Reporter had been made aware of an issue regarding high oil consumption on the referenced engine on previous flights. Nr6 cylinder had low compression on testing. Nr6 cylinder removed and two of the cylinder head rings were seen to be damaged.
201315741	04/12/2013	En route	EGNE : Repton/Gamst on		EGTT : London (FIR)	DIAMOND	Reciprocating	1	Uncommanded engine shutdown.	Approx 15mins into stable cruise on autopilot with the power set at 73%, the engine suddenly wound down to 0% power. No warning, cautions or abnormal engine instrument readings. Checklist procedure carried out and the electronic engine control unit (EECU) voter switch moved to different settings, when moved from 'AUTO' to 'A' the engine returned to normal but with 'ECU A FAIL' and 'ECU B FAIL' intermittently showing. Subsequent engineering investigation has found a broken wire inside a crimp joint. Internal investigation ongoing.☐ CAA Closure: ☐ The TC holder believes this is an isolated case of mis-assembly, however the defect has been highlighted to their production and maintenance staff. Additionally, this case was discussed with the EASA PCM and the investigation results have been in principle agreed that based on the service experience with the fuse-installation and the procedure/voter switch in place, this can be seen as an isolated case. The connection was subsequently repaired law standard wiring practise and systems operated normally.
201316422	17/12/2013	Take-off	EGLL (LHR): London/Heath row		EGTT : London (FIR)	AIRBUS	Turbofan	2	Fire warning nr2 engine.	Aircraft outbound climbing to FL230 sustained fire warning n2 engine. Warning cleared before aircraft returned and made a normal single engine landing.
201316814	28/12/2013	En route	Overhead Welshpool		EGTT : London (FIR)	SOCATA	Reciprocating	1	PAN declared due to rough running engine, aircraft returned.	Aircraft was on frequency with FIS from 1644hrs en route at 4.0". At 1702hrs the pilot declared a PAN with a rough running engine and requested if local airport was open for landing. The aircraft was maintaining its level with an engine speed of 24rpm. There was no answer from using the published number from the which also stated the airfield usually closes at 1700hrs. I passed this information back to the pilot. Another pilot on frequency stated that airfield was expecting him at approx 1745hrs and also passed to me the alternate telephone contact airport manager. There was no answer from this number, a message was left by us. I informed the pilot of this information. At this point I requested that he squawk 7700 and contact London Centre on 121.5. ☐ Supplementary 28/12/13:☐ Aircraft called D&D on 121.5 after being transferred by London Information suffering a rough running engine. Aircraft unable to raise a diversion airfield on frequency. He subsequently requested a steer to departure airfield stating he had intermittent engine problems. The ac was given a steer and asked to report visual. When approx 12nm pilot stated that the ac was no longer showing any malfunctions but wished to remain on 121.5 until visual with the airfield.
201316818	29/12/2013	En route	EGSH (NWI): Norwich		EGTT : London (FIR)	FOKKER	Turbofan	2	PAN declared and aircraft diverted due to engine failure.	Aircraft declared a PAN call due to engine failure. Pilot reported a failure in engine number 2, having to shut it down. Pilot subsequently reported situation under control and requested diversion. A Planner was requested to carry out coordinations, and a/c was descended into airport.☐ Supplementary 29/12/13:☐ Aircraft was handed over on a diversion whilst en route, with severe engine vibration on nr2 engine, which was shut down. A full emergency was initiated and the aircraft landed safely.
201400352	11/01/2014	Take-off	EGMC (SEN): Southend		EGTT : London (FIR)	CIRRUS	Reciprocating	1	Full emergency and aircraft return due to rough running engine.	Soon after departure aircraft reported a rough running engine. Full emergency declared. Aircraft returned.
201400721	22/01/2014	En route	EGNR : Hawarden		EGTT : London (FIR)	HAWKER SIDDELEY	Turbofan	2	MAYDAY due to nr1 engine failure and associated oil leak. Aircraft returned.	Aircraft departed off Rwy 22 and as the aircraft was transferred to Scottish Control I was informed by Scottish that the pilot had declared a Mayday with an engine failure and was returning. All relevant agencies were involved and a full emergency was declared. I was given operational control of the aircraft and the airspace was delegated to me to use as required. I instructed the pilot to squawk Mayday and he informed me he needed to hold for approximately 5 minutes prior to recovery. After further checks, the pilot confirmed that number 1 engine had failed and it had an associated oil leak and that after landing he would require to vacate at Holding point D and then shut the aircraft down. The pilot requested an extended pattern for a radar vectored ILS approach to Rwy 22. The aircraft landed safely at 1526Z.
201401579	10/02/2014	Approach	EGSH (NWI): Norwich		EGTT : London (FIR)	AGUSTA BELL	Turboshaft	2	PAN declared due to engine chip light. Aircraft landed with one engine shut down.	Aircraft was approx 3nm north of the airport on a visual left base for runway 09 when the pilot declared a "PAN" with one engine shut down. Full Emergency declared. Aircraft landed safely with RFS in attendance and taxied back to stand with the RFS following.☐ Supplementary 10/02/14:☐ NO.2 Eng chip light in flight. Emerge checklist carried out, engine shut down. Running landing carried out
201401817	15/02/2014	En route	EGNS (IOM): Isle Of Man/Ronalds way		EGTT : London (FIR)	LET	Turboprop	2	Loss of power in LH engine. Engine shut down in flight.	Aircraft was being vectored downwind left for runway 26. At approx 4nm SE, the pilot reported an engine failure, LH, emergency under control and that they wished to continue on the ILS. APS called to advise me of this at which time the pilot reported visual. I agreed to take the aircraft straight away. Full emergency was called. Once the aircraft was on my frequency, I asked for POB which they reported as nine plus two crew. This was passed to the ATSA and AFS on their initial call to me. AFS advised CAT6 was still available. Full emergency called 11:30. AFS called up 11:32. Aircraft landed 11:36. Incident closed 11:47.☐ Supplementary 17/02/14:☐ During radar vectoring for ILS approach runway 26 in descent flight crew observed loss of left engine power. Consequently autofeather system feathered LH propeller. Crew reported to ATC engine failure and performed in flight engine shut down. Flight continued descent and later requested visual approach. The visual approach was cleared and aircraft landed safely at EGNS. After the airplane was parked, oil leak from LH engine nacelle was observed. Engine manufacturer, aircraft manufacturer, CAA CZ, AAIB CZ advised. Engine failure investigation process coordinated with engine manufacturer, investigation open, maintenance organisation ordered to come to see the aircraft and engine All company operated aircraft engines were subject to immediate engine boroscope, engine run up tests had to be performed before next flight detailed inspection for oil leak was performed before next flight.
201401892	17/02/2014	En route	EGUN (MHZ): Mildenhall		EGTT : London (FIR)	LOCKHEED	Turboprop	4	PAN declared with engine shutdown due fuel conservation.	Aircraft declared a PAN whilst inbound to base. Nr1 engine was shut down to conserve fuel.
201401996	17/02/2014	Approach	EGTC : Cranfield		EGTT : London (FIR)	PIPER	Reciprocating	2	Precautionary shutdown of nr2 engine with request for priority landing.	Aircraft called up at advising of a precautionary engine shutdown of No.2 and requesting a priority landing. A/C had previously advised of a technical issue which prevented it from carrying out booked instrument training, but had reported it required no assistance. No urgency call was made but I called a full emergency, assessing the incident as one involving safety, and treated it as though a Pan call had been made. The A/C landed safely.
201402699	06/03/2014	Take-off	EGLL (LHR): London/Heath row		EGTT : London (FIR)	AIRBUS	Turbofan	2	PAN declared and aircraft returned due engine surge.	Nr2 engine stall shortly after take-off. Five loud bangs heard and possibly flames from the engine seen by the Tower. PAN declared and aircraft returned. ☐ Supplementary 07/03/14:☐ During gear retraction multiple loud bangs heard associated with fluctuating indications on Eng 2. Aircraft continued with departure and No 2 engine thrust lever retarded to idle. Stall indications were replaced by normal engine parameters. The cabin crew reported flames from the right hand engine during the event. Diagnosis and QRH action carried out in the hold and aircraft returned for an overweight "single engine" (the No2 thrust lever remained at idle throughout the approach) ILS to auto land rwy 27L. A PAN was declared and a NITS briefing carried out. 2 PA's made by the Captain to keep the passengers informed during flight. Forgot to get the tech log reference before leaving the aircraft.☐ Supplementary 20/03/14:☐ All ATC procedures were followed correctly. No further ATC investigation required.☐ CAA Closure: ☐ The engine HPC was borescoped and it was found that most of stage 6 blades had their trailing edges nicked and torn with one having had 1/4 of its blade broken from the tip. On stage 7, two blades were broken off from just above the platform. All other stage 7 blades were torn and had missing material. Stage 8 blades had missing material on most of the blades. The engine was removed and sent to the engine shop for investigation and repair and the reason for engine rejection was stage 6 damper wire breakage and contact with the stage 6 blade. Overttemperature analysis of the HPT1 and HPT2 blades provided satisfactory results and no further action was necessary. SB 72-0589 reintroduces the damper wire configuration pre SB 72-0472 to reduce frettage of 3-8 HPC drum and prevents damper wire breakage. This Bulletin will be accomplished on the fleet at shop visit.
201402749	07/03/2014	Take-off	ECBW : Wellesbourne mountford		EGTT : London (FIR)	PIPER	Reciprocating	1	Landing gear system malfunction.	During the ground roll of a flapless touch-and-go, the green nosewheel light extinguished and the gear unsafe light illuminated. It was decided to continue the take-off and leave the undercarriage selected down until at altitude in the local area. The gear was recycled several times and the checklist actions completed. It was not possible to establish a green nosewheel light and the gear unsafe light remained lit. A flypast of the tower was carried out and the ground observers reported no obvious malfunction. A full stop landing was carried out on R/W23 with the engine shut down. On landing, the gear remained 'locked' down. After inspection, the aircraft was taxied clear of the runway with no issues. Awaiting engineering report as to why the emergency extension system failed to work correctly.

201402773	06/03/2014	En route	En route	Southend	EGTT : London (FIR)	MOONEY	Reciprocating	1	MAYDAY declared due to rough running engine.	Aircraft declares a MAYDAY with a rough running engine. Aircraft was approximately 12NW of Southend at the time of the May Day at Approximately A1800ft. Aircraft requests the nearest airfield for a divert. I suggested North Weald or Stapleford as neither required a significant change of track and both units are equipped with emergency aid (I also suggested some minor airstrips that were closer). Aircraft initially requested North weald at which point a suggested track to fly was given. I coordinated A3000ft inside CAS with Essex radar in case of climb and coordinated the arrival with North weald. Aircraft then advised he was diverting to Stapleford. At this point I provided a suggested track and coordinated with Stapleford his arrival. Relevant wind speeds and pressure was passed together with further suggested tracks until aircraft had Stapleford in sight and subsequently landed. A report from Stapleford via the phone and a relayed message confirmed that aircraft had landed safely.
201403097	15/03/2014	En route	EGFA : WEST WALES/ABERP ORTH		EGTT : London (FIR)	EUROPA	Reciprocating	1	PAN declared due to engine misfiring.	The aircraft was requested to squawk 7700 and radio silence imposed on frequency. Aircraft reported his current position and intention to divert to the nearest available airfield. London Centre was informed. Due to problems getting 2-way comms with aircraft, another aircraft on frequency in the vicinity, acted as a relay between London Information, D and D, and the Pan traffic. Both aircraft changed frequency to 121.5, other aircraft remaining in the area to assist until the aircraft landed safely.
201403184	17/03/2014	En route	EGBB (BHX): Birmingham		EGTT : London (FIR)	DE HAVILLAND	Reciprocating	1	Aircraft returned due to misfiring engine.	I was working as the tower controller (AIR & GMC combined) when formation were taxiing to the holding point for Runway 33. The formation reported ready for departure, and they were lined up via F1 Runway 33. After obtaining a release from RADAR, departure clearance was issued to aircraft. Shortly after the formation got airborne aircraft requested an immediate return to the field due to a 'misfiring engine'. I asked if an emergency was being declared, to which aircraft responded 'we will require fire service attendance'. Aircraft advised they were to continue as cleared, and identified the aircraft downwind right as the aircraft in distress. I immediately declared an Aircraft Accident Imminent on the CRASH line (time 1511). I instructed the vehicle holding at C2 to vacate the area, and instructed the aircraft lined up to vacate via C due inbound emergency traffic. Once the runway was clear, aircraft was given landing clearance. The aircraft made a safe landing and vacated at L. Aircraft advised no further assistance was required and the fire service were stood down. Aircraft taxied under his own power to the Apron.
201403891	02/04/2014	Approach	EGNX (EMA): NOTTINGHAM EAST MIDLANDS		EGTT : London (FIR)	DE HAVILLAND	Turboprop	2	Nr2 engine shut down in flight due to indications of decreasing engine oil pressure. Aircraft diverted.	On approach, the First Officer noticed that the Number 2 Engine Oil Pressure was decreasing. Both crew watched the pressure indication drop to below 44psi requiring an Engine Shutdown as prescribed in the Company Standard Operating Procedures. The Pressure indication then began to fluctuate and was temporarily back within normal operating range before once again dropping below 44 psi. It was at this point that the decision was made to Shutdown Engine Number 2.The possibility of a faulty sensor was discussed but the decision was taken to remove any doubt and complete the shutdown of the engine. The PF levelled the aircraft at 8000 feet and ATC were advised of a problem. The crew then routed towards the hold. En route to the hold the Cabin Crew called the Flight Deck to advise that the Cabin was secure for landing. The opportunity was taken to warn the cabin crew of the impending Shutdown and that a NITS brief will follow as soon as time permitted. The Engine shutdown was then completed using company procedures, Vital Actions then Quick Reference Handbook to back up. Subsequent actions were then completed. ATC were informed of our actions and that the aircraft was to remain in the hold until a decision was made on the intentions. The Cabin Crew were again informed that a NITS brief would follow shortly. The Crew then obtained the weather for both options. The conditions at original destination were not ideal and although a trickier approach was required at Alternate the decision was made to divert to improve the chances of arrival off of a single approach. At this point the NITS was given to the Cabin Crew and the Passengers were informed of the divert as well as the reasoning behind it. The First Officer remained Pilot Flying and followed ATC vectoring towards an NDB/DME approach. A normal approach was flown by the First Officer and control was handed over the Captain to make the Single Engine Landing when Visual Reference with the runway was made. A normal Landing was made and the aircraft was then taxied onto stand without further issue. Passengers disembarked onto a bus back to the terminal and their onward travel back to the original destination. During the level off in the descent toward the hold, the QNH had been set and this was missed by the crew. ATC were advised that the aircraft was levelling at Flight Level 80 rather 8000 feet which it was actually at. It was noticed by the First Officer whilst changing from the first Approach to the other. The height discrepancy would have been approximately 135 feet between Flight Level and Altitude. During the approach the decision was also made to leave the Autopilot engaged whilst the aircraft was stabilised on the non-precision approach, contrary to Standard Procedure. This enabled the aircraft to be stabilised and trimmed correctly before disengagement of the autopilot. It also greatly increased the mental capacity of both PM and PF. The Auto Pilot was disengaged by the Captain when taking control of the aircraft when sufficient visual reference had been seen. Once the passengers had left the aircraft the crew had a de-brief on-board. No further flights were operate by any of the crew following the incident. Engineering organisation passed comment that the aircraft had history relating to this fault. ☐ Supplementary 02/04/14: ☐ I was on watch as the Radar 1 Controller. I took a call from Approach informing me that subject aircraft had declared a PAN and was holding with his No2 engine shut down. The aircraft Captain was looking at his options and had asked how long it would take to bring the ILS RW15 into service. I telephoned the ADM, briefed him on the situation and was informed it would take approx 30mins to clear the contractors. This information was passed on. Aircraft was diverting for a NDB/DME approach. I then telephoned the Air Controller, who was also the DWM, and briefed him. Aircraft was handed over, vectored for the NDB/DME procedure RW15 and handed over to Tower. The Tower controller initiated a Full Emergency and the Stop Message was later issued. ☐ CAA Closure: ☐
201404092	25/03/2014	En route	En route		EGTT : London (FIR)	OTHER	Unknown		Aircraft declared PAN due to engine shutdown.	Pilot requested a direct routing. After I refused the request the pilot advised they had a maintenance issue and had shut down engine 4 and needed to go direct to destination. Pilot eventually declared a PAN and planner was called in to facilitate direct routing. Pilot offered alternative but refused.
201404547	14/04/2014	En route	EGMH (MSE): Manston (Civil)		EGTT : London (FIR)	CESSNA	Reciprocating	1	MAYDAY declared due to engine problem.	ADC/APP training. Call received from the London FIR regarding subject aircraft with an engine problem, requesting to divert. ADC/APP training terminated. Aircraft called 'Mayday' on initial call 132.450Mhz and was acknowledged. (NOTAMed closed 0800-1700z due staffing and AD NOTAMed closed due staffing 1200-1230z). ATM used to monitor the aircraft and to pass range checks for a left-base joining RWY28. Local Standby initiated, with the option to upgrade, if the situation deteriorated. Aircraft landed safely at 1210z. AFS Fire Commander closed the incident at 1221z. London D&D and FIR advised the aircraft had landed safely.
201404593	15/04/2014	Manoeuvring	EGSH (NWI): Norwich		EGTT : London (FIR)	CESSNA	Reciprocating	1	MAYDAY declared due to engine failure.	Aircraft had departed for a 20 minute local flight with 2 pob. Whilst manoeuvring on a Basic Service the pilot declared a MAYDAY with an engine failure. The commander reported that he was attempting to land in a field in the vicinity. The mayday was acknowledged and the surface wind was passed. The local emergency services were alerted via 999 and remained on the line awaiting information of the possible landing site. The pilot then reported that he had managed to gain some power and that he would attempt to land. An approx heading of 140 was passed and surface wind again. I also informed the pilot that no traffic was observed on radar in the vicinity. Once the pilot was confident that he could safely glide to the airfield he cancelled the distress and continued to land. The local emergency services were informed that they were no longer required. The pilot called on the telephone to say that everything was ok. D & D were informed after the event.. ☐ Supplementary 2/5/14: ☐ Engine failure date not known but believed to have been mid April 2014. The condition of this aircraft in my opinion renders this aircraft un-airworthy until the items identified have been repaired/re-inspected. The removed items have been retained for inspection. The fuel has been kept. Details of manufacturer lived component replacement requirements can be found in the maintenance manual. The aircraft has been left in a condition in which it cannot be flown. The reporter believes this aircraft may be used for flight training. Reporting organisation do not maintain this aircraft but was contacted to undertake rectification following an in flight engine failure. The pilot claimed the only way he could retain power from the engine was by the use of the engine primer pump. Maintenance has been carried out at airfield by another maintenance organisation following this incidence. We were then contacted (by the owner or his representative) and instructed to drain the fuel tanks and carry out a complete filter check of the fuel system. We have drained the fuel system and found contamination of water, rust and what appears to be rubber. However the reporter is more concerned with the overall condition of this aircraft and the airworthiness state of the aircraft. The fuel does appear to be 100LL Avgas Airworthy items found during a walk-round inspection:- Rudder horn is loose on the rudder due to loose/working rivets, port aileron control rod attachment brackets loose in the aileron due loose/working rivets, pilot's door frame cracked due to exfoliation corrosion & cracked frame, STB brake hose from the leg to brake calliper visible exfoliation corrosion and appear to be well beyond the manufacturers life limit (see section 2 MM), port brake hose ditto, engine oil pressure hose between engine and fire-wall - although the union at the engine end was found tight the hose is loose in the aeroquip union and appear very old and beyond the manufacturers life limit. Carburettor has what I would consider to be excessive play in the throttle arm and carb body (I believe this item may have been changed following the engine failure), fuel gaculator filter distorted and crushed ? fuel cap seals age cracked, pilots internal door pull (to close door) missing, window catches broken, considerable external corrosion of the engine cylinders, exhaust outlet pipe clamps heavy corrosion, exhaust pipe clamp bolts/nuts heavy corrosion (to the point that a spanner may not retain to remove them) engine induction hoses very age hardened and cracked, Placard required law AD 2009-10-09 (non modified rudder horn) missing, starter warning placard missing, many other defects noted. Please note that this report is not complete and indicates what was found following just a walk round inspection and our basic inspection on the fuel system. In the opinion of the reporter it is in a poor state of airworthiness. ☐ CAA Closure: ☐
201404602	11/04/2014	Approach	EGBG : Leicester		EGTT : London (FIR)	FLY BUY ULTRALIGHTS	Reciprocating	1	UK Reportable Accident: Pilot unable to reduce power after take-off. Engine stopped intentionally. Area of sink caused aircraft to land heavily. One POB, no injuries. AAIB AARF investigation.	CAA Closure: ☐ After takeoff, the pilot found that he could not reduce power from the takeoff setting. He climbed overhead the airfield before intentionally stopping the engine and carrying out a glide approach. An area of 'sink' caused the aircraft to land heavily short of the runway. It was found that the throttle linkage had fouled a hole in the centre console side panel, causing it to jam. This was a problem known to the agent/distributor for the aircraft type, who had issued a recommended Service Bulletin in 2010 containing details of an inspection and modification to overcome it. The subject aircraft did not have the modification embodied. AAIB Bulletin 09/2014, Ref: EW/G2014/07/05.
201404827	16/04/2014	En route	EGTK (OXF): Oxford/Kidlington		EGTT : London (FIR)	PIPER	Reciprocating	1	Aircraft returned due to rough running engine.	At the time of the incident I was the tower controller. The approach controller rang to say that aircraft 1 was returning to the airfield with a rough running engine. A local standby was called and fire vehicles were in position at holds. Aircraft joined normally and landed safely. The pilot elected to taxi in under his own power and vacated the runway, escorted by the 2 fire vehicles. Whilst aircraft was taxiing in, aircraft 2 in the circuit announced intermittent smoke from his right hand engine. One fire engine (Fire 2) had just commenced a runway inspection and this vehicle was re-directed to hold D to commence a local standby. The other fire engine (Fire 4) continued to escort aircraft 1 to the apron. Aircraft 1 shut down on the apron and this incident was closed. Fire 4 proceeded to holding point C to assist Fire 2. Aircraft 2 landed safely and was followed on the runway by both fire vehicles. Once again the pilot elected to taxi in, after shutting down the smoking engine on the 'A' taxiway. The a/c proceeded to parking without any problem and this incident was closed. The reason for aircraft 1 rough running engine is not known at the time of writing. Aircraft 2 was reported by the fire service to have an oil leak. The runway was finally inspected by Rover 2 whilst aircraft 2 was taxiing in. Normal runway operations were resumed.
201404827	16/04/2014	En route	EGTK (OXF): Oxford/Kidlington		EGTT : London (FIR)	PIPER	Reciprocating	2	Aircraft returned due to rough running engine.	At the time of the incident I was the tower controller. The approach controller rang to say that aircraft 1 was returning to the airfield with a rough running engine. A local standby was called and fire vehicles were in position at holds. Aircraft joined normally and landed safely. The pilot elected to taxi in under his own power and vacated the runway, escorted by the 2 fire vehicles. Whilst aircraft was taxiing in, aircraft 2 in the circuit announced intermittent smoke from his right hand engine. One fire engine (Fire 2) had just commenced a runway inspection and this vehicle was re-directed to hold D to commence a local standby. The other fire engine (Fire 4) continued to escort aircraft 1 to the apron. Aircraft 1 shut down on the apron and this incident was closed. Fire 4 proceeded to holding point C to assist Fire 2. Aircraft 2 landed safely and was followed on the runway by both fire vehicles. Once again the pilot elected to taxi in, after shutting down the smoking engine on the 'A' taxiway. The a/c proceeded to parking without any problem and this incident was closed. The reason for aircraft 1 rough running engine is not known at the time of writing. 201404862	22/04/2014	Approach	EGLL (LHR): London/Heathrow		EGTT : London (FIR)	BOEING	Turbofan	2	PAN declared due to engine failure then upgraded to a MAYDAY on approach.	Working as Sector controller bandboxed, with a busy stack and 10 mins delay. Aircraft with 6 miles to run to the hold declares a PAN with one engine shut down. I immediately vectored the a/c away from holding traffic, assigned squawk 7700, and coordinated descent into NE Airspace, and onwards to APC. No further incident in my airspace. A/c QSY'd to Approach. Upgraded to MAYDAY on Approach frequency.

201404875	19/04/2014	En route	Branscombe Airfield	1 nm North	EGTT : London (FIR)	EUROPA	Reciprocating	1	UK Reportable Accident: On declaring MAYDAY due to misfiring engine, aircraft carried out a forced landing following an aborted landing. Two POB, no injuries. AAIB AARF investigation.	CAA Closure:☐ The aircraft's engine began misfiring during flight. The pilot made two attempts to land at a nearby airstrip but on each occasion the aircraft was high and had to go around. After the second go-around, the engine stopped and the pilot made a forced landing in a ploughed field. The nosewheel dug into the surface, causing damage to the aircraft. The pilot reported that a blocked fuel filter may have been the cause of the engine misfire and eventual stoppage. AAIB Bulletin 08/2014, Ref: EW/G2014/04/12.
201405132	18/04/2014	Take-off	EGNW : Wickenby		EGTT : London (FIR)	CFM	Reciprocating	1	MAYDAY declared and forced landing made in a field due to engine failure on take-off.	The Pilot had been flying locally for approximately 45minutes. On return to the airfield he wanted to complete 3 landings/circuits. On the third circuit he was climbing out when at approximately 300 feet overhead the upwind threshold of the runway the engine lost power, he then proceeded to lower the nose checked the throttle was fully open and exercised the throttle in case he could clear any obstruction. This had no effect and so he selected a field ahead, placed a 'mayday' call over the radio and landed ahead uneventfully. He then made the aircraft safe, notified the airfield as soon as he could that he was ok and waited for recovery. The aircraft was recovered to its hangar. IER arrived to aircraft within a couple of minutes, land owner was notified and aircraft recovered by foot back to airfield.
201405650	02/05/2014	En route	Louth		EGTT : London (FIR)	QUAD CITY	Reciprocating	1	UK Reportable Accident: During climb, rpm increased and drive to the propeller became disconnected. During forced landing, aircraft stalled and the aircraft was damaged. Two POB, no injuries. AAIB AARF investigation.	CAA Closure:☐ During a check flight the pilot applied full power prior to conducting a timed climb. However, the engine rpm suddenly increased and it became apparent that the drive to the propeller had become disconnected. The aircraft was damaged in the subsequent forced landing, although the occupants were uninjured. It was found that the drive belt that connected the engine driveshaft to the propeller shaft, located immediately above the engine driveshaft, had migrated out of the groove in the lower pulley. This may have been the result of a degree of misalignment between the engine driveshaft and propeller shaft. AAIB Bulletin 11/2014, Ref: EW/G2014/05/01.
201405784	07/05/2014	Manoeuvring	EGBK (ORM): Northampton/ Sywell		EGTT : London (FIR)	EXTRA	Reciprocating	1	Engine shut down to execute a forced landing following throttle cable failure.	The aircraft was being flown as Number 4 of a 4 ship formation aerobatics training sortie. During a formation move from Finger 4 to Line Astern, it was noted that movement of the throttle lever had no effect on the power being delivered by the engine. In accordance with Company Standard Operating Procedures the aircraft was safely manoeuvred away from the other aircraft in the formation, and positioned toward HI-Key. Whilst positioning the aircraft towards HI-key a 'handling check' was carried out which established that the throttle lever was not controlling the engine and that the power was fixed at 27 inches of Manifold Air Pressure: this power setting was too high to affect a safe recovery and landing with the engine running. Having positioned the aircraft above Lo-key and when sure of being able to achieve a safe landing, the engine was shut down. The aircraft was landed safely following an Actual Forced Landing. This was a serious emergency that was commendably handled by the pilot resulting in a safe outcome for both the pilot and the aeroplane. Following an investigation by the Part 145(M), it was established that the cause of the malfunction was the failure of the throttle cable. The throttle cable is a metal rod, protected by an outer sheath that connects the rear throttle lever to the fuel injection throttle body. The metal rod had sheared approximately where the throttle cable passes through the firewall bulkhead. No visible damage or kink could be identified in that area though. The aircraft has less than 500hrs total and the cable had not been disturbed since it was installed at manufacture. The Part 145(M) has extensive experience maintaining these aircraft and has not seen or heard of this failure before. The aircraft manufacturers were informed immediately, who stated that there are no previous records of this type of failure. Being a sealed cable, it is impossible to check the status of the other aircraft in the Company's fleet. However, the fact that this issue has not been seen before in a large worldwide pool of aircraft would indicate that it is either a one off or of extremely low likelihood. As such, the Company have recommenced flying the other aircraft within its fleet. The Company's investigation and subsequent reporting process remains open and will conclude in due course.☐ CAA Closure:☐ The aircraft TC-holder was contacted, and the failed throttle cable sent away for factory examination. The TC-holder advised that this was the first occurrence of a snapped core wire within this throttle control cable assy (CC330 10ft). The position of fracture of the core was exactly where the bowden cable passes through the firewall. As both sides of the throttle cable core wire could not pass through this position, the TC-holder prepared a cut-away at this position of the cable. It was found that the inner HDPE liner was ruptured (gap of 3mm) and that deposits grinded from that inner liner blocked that position. A sharp bend at this position of the control cable assembly was suggested as the most probable reason for the failure by the TC-holder. In the opinion of the Part-145 organisation, the only way a sharp bend could have occurred would be at installation. The SMS determined that the likelihood of recurrence of the failure was minimal, due to the time accumulated on the subject aircraft against the accumulated flying hours in the fleet worldwide. It is not possible to check the condition of the throttle cable core wire in other aircraft without destroying the cable. The TC-holder have filed an occurrence report with EASA, and are continuing their investigation. We await conclusion of the EASA occurrence report and a conclusion from the TC-Holder/EASA in due course. Despite the low chance of Aircraft contacted Radar at 1507 on a local flight at Altitude 3000 feet requesting a Basic Service. At 1512 PAN-PAN call made advising of a 'chip warning indication' with the intention of returning. Position 25nm with 3 persons on board. Airfield and D&D were advised with operational control of the incident retained by ATC. At 1513 a/c called shutting down right hand engine: at 1514 a/c reported airfield in sight and requested frequency change which was acknowledged, with squawk retained for radar monitoring purposes. Subsequent telephone call received advising that the a/c landed safely at 1520. D&D advised.
201405912	12/05/2014	En route	EGBP : KEMBLE		EGTT : London (FIR)	AEROSPATIAL E	Turboshaft	2	PAN declared due chip warning.	Aircraft contacted Radar at 1507 on a local flight at Altitude 3000 feet requesting a Basic Service. At 1512 PAN-PAN call made advising of a 'chip warning indication' with the intention of returning. Position 25nm with 3 persons on board. Airfield and D&D were advised with operational control of the incident retained by ATC. At 1513 a/c called shutting down right hand engine: at 1514 a/c reported airfield in sight and requested frequency change which was acknowledged, with squawk retained for radar monitoring purposes. Subsequent telephone call received advising that the a/c landed safely at 1520. D&D advised.
201406235	18/05/2014	En route	EGCJ : Sherburn-In-Elmet	3-4nm West of EGCJ	EGTT : London (FIR)	DIAMOND	Reciprocating	1	MAYDAY declared due to increased RPM, warning lights and rough running engine. Forced landing.	Aircraft departs VFR 1 pob, after leaving CAS under a BS, pilot declares Mayday, and wishes an immediate return. Aircraft given surface wind as RW 32 did not seem an option. Captain then requests diversion with an initial vector, the A/C was observed slowly descending. The pilot was stated his issue as, increased RPM, warning lights, and a rough running engine which was losing power. Latest information was passed onto the pilot at which point he stated he would not make airfield and had chosen an Airstrip 3-4nm west of diversion airfield. A/c landed safely. ☐ Supplementary 27/05/14:☐ After a normal departure and shortly after leaving Departure Zone the pilot initiated a further climb when the rpm rose to the red zone and the pilot reduced the power setting to reduce revs. He then got first ECU A FAIL and shortly after ECU B FAIL. At this point he called Mayday and with the rpm continuing to be "uncontrollable" made a successful landing. After landing he reports a good deal of oil on the lower airframe and the gear box inspection window empty.☐ Supplementary 29/05/14:☐ Union on the end of the above pipe was found to be cracked allowing the gearbox oil to deplete during the flight. Engine manufacturer has been advised of the parts failure.
201406627	24/05/2014	Approach	EGGW (LTN): London/Luton		EGTT : London (FIR)	HAWKER SIDDELEY	Turbofan	2	PAN declared due to engine failure.	Aircraft declared a PAN at 5nm final for runway 26 due engine failure. Full Emergency initiated. Aircraft landed without incident.
201407396	05/06/2014	Take-off	Parham Park		EGTT : London (FIR)	PIPER	Reciprocating	1	UK Reportable Accident: Tow plane had engine failure. Glider struck tree following emergency landing. Two POB, no injuries reported. Aircraft substantially damaged. Investigation referred to the BGA.	CAA Closure:☐ Following investigations, tug pilots should consider immediate an radio call in event of engine failure. Glider pilots should refresh 'side-slip' skills and develop an optimum "Brace" position. Investigate the possibility of fitting more shock-absorbent cushions.
201407396	05/06/2014	Take-off	Parham Park		EGTT : London (FIR)	SCHLEICHER	Other	0	UK Reportable Accident: Tow plane had engine failure. Glider struck tree following emergency landing. Two POB, no injuries reported. Aircraft substantially damaged. Investigation referred to the BGA.	CAA Closure:☐ Following investigations, tug pilots should consider immediate an radio call in event of engine failure. Glider pilots should refresh 'side-slip' skills and develop an optimum "Brace" position. Investigate the possibility of fitting more shock-absorbent cushions.
201407451	08/06/2014	En route	EGBE (CVT): Coventry		EGTT : London (FIR)	BAE	Turboprop	2	Engine flameout.	Descending through FL140 (light icing, moderate rain and light turbulence, OAT -7C) with approximately 50% torque and continuous ignition set, the LH engine torque dropped to zero with a corresponding yaw and reduction in associated engine instruments. Re-light took between 5 and 10 seconds. Aircraft had recently cleared an area of moderate/heavy icing and rain requiring use of airframe de-ice in heavy mode.☐ CAA Closure:☐ Root cause suspected to be ice ingestion into engine. FDR data confirms typical profile of NH, NL, TQ reduction following ice ingestion and subsequent recovery. Inspections of engine intake carried out. The interface between the intake lip and the flexible duct was found to have an into-wind step of greater than 0.020" (beyond manufacturer limits) and the intake lip was found to have areas of suspected delamination and poor paint finish. The intake lip was replaced and the into-wind steps were adjusted out. There were no other findings. Additionally, the aircraft manufacturer recommended inspections to confirm correct embodiment of Service Bulletins related to a/f bonding be carried out. Two were found not embodied in full and rectification work was carried out law the SBs. The aircraft manufacturer included this incident in ongoing investigation of TQ rollback events. As part of that investigation they requested the operator to carry out fleet checks for condition of engine air intake de-ice systems and also of service bulletin status of certain SBs. The manufacturer has concluded that, based on results of fleet inspection, the electrostatic build-up is due to a combination of inadequate bonding of the engine de-ice timer and the proximity of the aircraft to CBs and other known 'high' electrostatic conditions. This can cause a disruption of the engine de-ice system control schedule which in turn can result in inadequate ice protection leading to ice ingestion of sufficient quantity as to cause a transient reduction in TQ. Therefore, the primary preventative action is to ensure compliance with critical Service Bulletins, which have already been achieved on this aircraft. The aircraft manufacturer is subsequently working to determine and define any additional action which will be required as a result of their findings.
201407541	06/06/2014	Take-off	EGGP (LPL): Liverpool		EGTT : London (FIR)	PIPER	Reciprocating	2	Aircraft returned due to suspected oil leak from LH engine.	Approaching 3000ft to level off I noticed what appeared to be a puff of smoke from the left engine which was then followed by an oil stream which eventually stopped. I checked the oil temperature and pressure gauges which appeared normal. I elected to reduce the power on the left engine as a precaution and elected to land back at departure airport. Once on the ground, the aircraft was checked by a LAE who found that an elbow on the breather pipe had perished.☐ Supplementary 28/06/14:☐ Tech log 3164 - Pilot report - Suspect oil leak - Action Taken - LH engine lower breather elbow found split, serviceable elbow fitted. Top cowl refitted. Precautionary return to departure airport taken by the pilot. Local Part 145 assisted in investigating the defect. LH engine silicon elbow breather tube found split. Engineer dispatched with required spares on aircraft positioning to take over from this aircraft. Engine had been recently replaced (due overhaul) and the original breather tubing assembly re fitted after cleaning and inspection. No oil leaks were observed during post installation runs. The aircraft also had a check 2 performed where no defects were noted regarding this engine breather installation.CAM noted 1981 service letter No 878A for the correct alignment of the LH breather tubing and Part 2 which revised the layout of the tube. Alignment was not the issue here nor would of modifying the tube layout have prevented this defect. Part 145 provider advised. Suitable action taken. Again, pleased that the pilot decided to return to the airfield.

201407779	13/06/2014	Take-off	EGSH (NWI): Norwich		EGTT : London (FIR)	EUROCOPTER	Turboshaft	2	Aircraft returned with engine failure caption.	Aircraft had just departed to an incident when the pilot stated that he was returning to the airport with an 'engine failure caption' although he stated that both engines were operating normally. The pilot stated that he did not want to declare an emergency and he did not require the emergency services. I informed the pilot that he may land anywhere and that the emergency services would be called. A Local Standby was initiated. The aircraft made an approach and landing to its normal operating pad and the emergency services attended until the aircraft had shut down.☐ Supplementary 17/06/14:☐ At approx 200ft AGL the master caution illuminated and ENG FAIL in Nr2 system in the CAD. On checking Nr2 all parameters were normal and the engine was still running. Aircraft returned. Engine connections checked and found satisfactory. DPHM monitoring kit fitted and the aircraft test flown taking real time data. No captions or faults. Email from manufacturer confirmed that engine was serviceable.
201407812	10/06/2014	Take-off	EGKA (ESH): Shoreham		EGTT : London (FIR)	CESSNA	Reciprocating	1	Engine failure during take-off. MAYDAY declared.	Aircraft given take-off clearance when at holding point K1 and observed taxiing onto runway 20 and moving forward commencing run. Pilot declares 'Mayday engine failure' as aircraft slows to a stop and propeller stops turning. Pilot states that unlikely to restart engine. Aerodrome RFFS attend and tow aircraft back to its parking stand.
201408100	20/06/2014	En route	EGCC (MAN): Manchester/In tl		EGTT : London (FIR)	DE HAVILLAND	Turboprop	2	MAYDAY declared due engine failure.	Aircraft called a Mayday at around 20:02UTC and reported engine failure and requested to descend to FL150 (was maintaining FL240 at the time). Was positioned overhead WAL at the time I think. I acknowledged the Mayday and asked the aircraft to squawk 7700 and report his intentions when able. He said he wanted to remain on the heading and descend to FL150 and he would inform us of his intentions in due course. I carried on working the rest of the traffic whilst monitoring the emergency aircraft and my planner TOSR'd departures into our sector. A few minutes later the aircraft asked which RWY was in use at diversion airfield (23R) and informed us he would like to divert there and that he was 'normal nav' and could accept headings. I turned him left onto heading 130. I asked him to report which engine had failed and he said engine no. 2. We liaised with CC approach and coordinated a downwind heading. I transferred the aircraft heading towards MRSI descending to FL60.☐ Supplementary 22/6/14:☐ Aircraft was diverted due to a technical fault. The aircraft was met by emergency services as a routine and precautionary measure. All the passengers disembarked once the aircraft landed.☐ Supplementary 22/6/14:☐ Cruising at FL240 at 240 knots, the number 2 engine abruptly oversped, stabilising at 1060 RPM, followed by a Number 2 PEC caution on the CWP and a "POWERPLANT" message. The cabin crew were told to stand by on the PA. Once we realised the engine needed to be shut down, the cabin crew were briefed that this was about to happen and then a PA to the passengers was made to let them know what was about to happen. With the First Officer handling, the Captain worked through the QRH drill for a single propeller overspeed and shut down the engine. a MAYDAY call was made and a descent to FL150 was requested as FL240 could not be maintained on one engine. After gathering information, and given our position we decided to divert. The cabin crew were given a NITS brief and the passengers were informed of the decision. The passengers remained generally calm throughout. The rest of the flight was benign and uneventful. The Captain took control before the approach and landed. After being reassured by the Fire Crews that the engine was safe, we taxied to abeam stand 71L where we shutdown and were then towed onto stand. After all passengers were disembarked, all crew members had a talk together about the incident.☐ CAA Closure:☐ Failure of No2 engine prop control unit and Beta feed back transducer. This Aircraft has now been fitted with a post mod BFT (Beta Feed Transducer) which should eradicate any further issues with this unit as there have been problems with pre mod units and a mod program has now been completed which has ensured post mod Beta feed transducers fitted on all of the organisations fleet to date.
201408278	22/06/2014	Manoeuvring	EGKH : Lashenden/He adcorn		EGTT : London (FIR)	OTHER	Reciprocating	1	Engine failure during display.	The aircraft is a Spanish built variant. During a private display at airfield a distinct and heavy vibration was felt during an aerobatic sequence. This was followed seconds later by a heavy "thud" from the engine and then a complete loss of power. Engine oil emitted from the engine cowlings leaving a visible trail and covered the right side of the fuselage and tail. The aircraft was "zoom climbed" to gain height from the speed at that time, and set up for a glide approach onto runway 10. During the approach another field was selected as a backup, this was due to the high descent rate which did not give confidence that the runway would be reached. It was noted that the elevator authority was low with the engine not producing any thrust. A steeper glide descent was necessary to overcome this. In the event it was considered the runway was achievable and the undercarriage selected down before the engine seized (the hydraulic pump is engine driven) The flaps were lowered to 5 degrees only to give slight lift and no drag. The aircraft landed just before the numbers and was brought to a stop within 3/4 of the runway. Although there was heavy oil smoke there was no fire. The airfield fire appliances were on the scene quickly and the aircraft made safe. Once aircraft is recovered to base a strip investigation of the engine will be carried out.☐ CAA Closure:☐ During investigations, the strip of the engine revealed failure was due to failure of the crankshaft. Less responsive pitch control after the event was due to the characteristics of aircraft at slow speed with a windmilling propeller. Full control regained at increased airspeed. No root cause could be determined but it may be that an unreported prop strike was a failure initiator. Operator does not propose further investigation.
201408658	29/06/2014	Take-off	EGHI (SOU): Southampton		EGTT : London (FIR)	CESSNA	Turbofan	2	Engine shut down due to lack of oil pressure during take-off and climb.	Approximately 15 minutes after departing the pilots closed one of the engines down due to lack of oil pressure. A full emergency was declared. Aircraft landed safely.
201408790	27/06/2014	Take-off	EGST : Elmsett	2nm North Hadleigh	EGTT : London (FIR)	CEA	Reciprocating	1	MAYDAY declared due to engine malfunction. Forced landing made in a field.	Nothing unusual on all pre-flight checks including power check. Took off on Runway 23 for climb to 2500ft heading 270. At around 1750ft engine rpm suddenly reduced to 1900. All usual checks including fuel, mixture, carb heat, mags, etc were performed but engine continued to run at 1900rpm and level flight could not be maintained. Aircraft was turned back but it became apparent that return airfield could not be reached and a decision was made to make a forced landing in a field. A Mayday call was made on 125.80 which was acknowledged by an unknown party. Aircraft was landed in a wheat field and there were no injuries to any of the three P.O.B. Upon landing the aircraft was vacated and a call was made to the police to report a safe landing. The police attended within 5-10 minutes. Engineers attended, reported only cosmetic damage to the aircraft and upon initial inspection of the engine suggested a valve failure. Aircraft was then left in the charge of the engineers.
201408944	02/07/2014	Take-off	EGHH (BOH): Bournemouth/ Hurn		EGTT : London (FIR)	DIAMOND	Reciprocating	1	Alternator belt failure during initial climb.	Shortly after take-off (approx 200ft). We heard a 'flapping' noise from the engine compartment, We reduced power, advised ATC and started to perform a low level circuit to land. Almost immediately we had an alternator failure warning, shortly after the coolant temperature rose into the red and oil pressure reduced into the amber range. A safe landing was made approximately 2 mins after the initial event. Once on the ground, the engine compartment was investigated and the alternator belt (V-ribbed Belt) was found to have failed. The aircraft in question was on loan from another flying school. The incident has been referred back to them and their engineering team.☐ Supplementary 22/07/14:☐ V-ribbed belt supplied as part of replacement engine installed 24-08-2010, being engine upgrade to Centurion 2. Photos of belt following failure show 'shredding' of belt into rib sections, belt not parted. Last maintenance activity affecting belt was scheduled alternator change at 599 engine hours. Belt not removed, but de-tensioned and freed from alternator pulley. Alternator replaced, belt tensioner manipulated to allow re-fitment of belt. Visual inspection of correct alternator installation, belt placement and tension carried out without any findings. Belt run for 39 hours in service before failure. Unable to attribute belt failure to last maintenance action due maintenance integrity and unit time in service.
201409093	06/07/2014	Take-off	EGKA (ESH): Shoreham		EGTT : London (FIR)	DE HAVILLAND	Reciprocating	1	Rough running engine on departure.	Full emergency declared. Investigation under 201312042.
201409157	22/06/2014	En route	0.5 nm north- west of Paddock Wood		EGTT : London (FIR)	STAMPE	Reciprocating	1	UK Reportable Accident: Aircraft pitched over during forced landing due to engine failure. One POB, no injuries. AAIB AARF investigation.	CAA Closure:☐ During flight the pilot checked he had sufficient fuel for the remaining 25 nm of the flight. At 1,700 ft amsl, the aircraft was caught in a "particularly harsh" thermal, shortly after which the engine "coughed". The pilot considered this to be so unusual that he decided to land immediately at a location east of current location; however, the engine then stopped. He checked the mixture, fuel and magnetos and set up for a forced landing in what looked like a hay field. At about 100 ft, positioned to land a third of the way into the field, the pilot realized the crop was rapeseed which he knew was much denser than hay. To try to reduce his forward speed on touchdown, he "deep stalled" the aircraft just above the crop; however, the undercarriage caught in the rapeseed and the aircraft slowly pitched over onto its back. With the magnetos and fuel off, he released his full harness and additional lap strap before vacating the aircraft unhurt. The pilot suspected that the problem was caused by the carburettor's float needle jamming in its base - a problem he was aware had occurred on another aircraft of the same type in 2013.
201409324	11/07/2014	En route	EGBK (ORM): Northampton/ Sywell		EGTT : London (FIR)	AGUSTA	Turboshaft	2	PAN declared and aircraft returned due to engine chip warning.	Aircraft declared a PAN. Pilot stated it was an engine chip warning light ,the engine had been secured and aircraft was diverting back. Pilot contacted ATC to advise aircraft landed safely. ACC supervisor informed by telephone 1602 completed.☐ Supplementary 11/07/14:☐ Nr2 ENG CHIP caution illuminated in cruise. Nr2 ECU shut down law EFRC. PAN call declared on in use ATC frequency and diversion back to departure airport carried out without further incident. Nr2 ECU chip detector inspected, small metallic sliver removed. Plug cleaned and 15min ground run carried out. Aircraft returned to service.
201409340	12/07/2014	En route	Bovingdon		EGTT : London (FIR)	PIPER	Reciprocating	1	Forced landing made in a field following loss of engine power.	Approx 25 minutes into the route, the engine stopped producing power. I was not able to recover the engine by switching to the other tank with the electric fuel pump on, so I was forced to pick a field to land in. I was approx 1 mile south of a VOR beacon at 2000ft. I did not put out a MAYDAY radio message, or select the Transponder accordingly, as I was now concentrating on picking a landing spot. I decided my best bet was to land on the disused airfield. This does not look like the image on Google earth, as this must have been taken a number of years ago. Of the two remaining runways only half the length of both was free to use, as a Saturday market takes up most of the south-western leg and hangars have been built on the south eastern runway. This left me with 2 halves of runways to chose from, however my altitude was decreasing rapidly and so I selected a north western heading to avoid some aerial masts and landed across the north east to south west runway, touching down initially in a corn field and running onto the runway at approx 45 degrees, I braked heavily and just stopped in the corn on the other side. Immediately people ran up to me with fire extinguishers, as car club used this portion of the runway, it looked empty to me as they were on a tea break. The aircraft was pulled out of the corn, to reduce the risk of fire to the crops. I was not hurt or injured by the forced landing, I was the only occupant of the aircraft. No fire broke out despite some fuel dripping out of the carburettor. No one was injured on the ground. The aircraft looks to be undamaged. I then phoned the local police and reported the incident. I then phoned the ATC Tower (departure airfield) and informed them also. The aircraft is still on the disused runway, until the maintenance engineer can assess the reason for the stoppage.

201409345	13/07/2014	En route	En route		EGTT : London (FIR)	BAE	Turbofan	4	PAN declared for emergency descent due to engine failure.	Aircraft came on frequency and called for emergency descent to fl250, however the level request wasn't heard due to significant stepping on the frequency due to workload associated with weather in the sector. The aircraft was given immediate descent along with being put on A7700, the Pan was acknowledged and another aircraft which was maintaining FL230 underneath was turned right to get out of the way in case he needed further decent, traffic information and reason for the turn was given. It was established that aircraft had lost number 3 engine and was now operating on three out of four engines, he could maintain height and continue to destination. In due course the Pob was established and the aircraft was transferred to destination.
201409827	21/07/2014	En route	EGLK (BBS): Blackbushe		EGTT : London (FIR)	PIPER	Reciprocating	1	Forced landing made in a field due to engine failure.	Aircraft was at 1.6A, approximately 4nm miles NE LK when the pilot declared a partial engine failure. I advised him of the distance and direction of the nearest airfield at the time and he acknowledged this. I then informed the airfield of the problem and that the pilot may elect to land there. Shortly afterwards I noticed the Mode C reduce to 1.3A and asked the pilot if he was able to maintain height. He said no so I asked him to squawk 7700 and again advised of his position in relation to the airfield. The pilot responded that he was going to land in a field as there was a built up area between him and LK. I advised D and D and relayed the co-ordinates of his last known position. The pilot did not have time to select 7700. The pilot made an r/t call when safely on the ground and a colleague also informed the local police.
201409886	22/07/2014	Take-off	EGFH (SWS): Swansea		EGTT : London (FIR)	PIPER	Reciprocating	1	MAYDAY declared and forced landing carried out on beach due to engine fire.	MAYDAY declared at 14:57 pilot reporting an engine fire and stating he was returning to departure airfield. I gave the aircraft a steer to return and telephoned the airfield to advise them of the situation. The pilot then reported that he may not be able to make it back to before stating that he was making a forced landing on a beach at his actual location was approximately 5 miles to the West of where he stated. D&D were advised and the airfield was kept up to date with the information. The pilot telephoned the unit a short time later to state that the aircraft was safely on the ground and that all three passengers were safe. (ATC Investigation Report received). Supplementary 26/07/14: 22nd of July, I was flying the aircraft on a private general aviation flight with two friends. The aeroplane was in a serviceable condition having undertaken a 50 hour check on 18th July 2014. The aircraft was being ferried. The aeroplane had a thorough visual inspection of the engine under the cowlings, the airframe, control surfaces and instruments as per the POH. The aircraft had been fully fuelled before departure and had an oil reading of eight. The aircraft was started at 15:40 local time and proceeded to taxi to runway 22 via taxiway Alpha and held short at alpha for a longer than usual engine run up as the aeroplane had not been flown for two weeks, the magnetos and carb heat was checked and the RPM drop was as expected. Due to the OAT and TOM, I expected a slightly longer take off run than usual which occurred, the RPM of the engine was 2350 which was usual, on handover to Radar, I reported passing roughly 1400ft for altitude 4000ft. Moments later the rate of climb was reduced, I called ATC and announced that we were maintaining 2000ft for the time being and levelled off with the intention to see if the air speed increased. At that time we were over the bay on a direct line track with the CPT VOR at 2000ft. Within seconds of levelling, we received rough running on the engine and carb heat was applied, an RPM drop of 300RPM was noted which was higher than normal, after a few seconds I decided to return to the A/D, before I could turn back and notify air traffic, a spray of oil was appearing on the windscreen on the right hand side and then grey smoke started coming out of the air vents in the cockpit, a MAYDAY call was made 15:50 roughly and we were told the airfield was in our 12 o'clock at seven miles (we had made a 180 degree turn), we could not make the airfield. Servo rough running and major oil leaked out about 1.5miles from the shoreline and we elected to land on the beach. An uneventful landing was made at 15:55 with no damage to aircraft or passengers. Supplementary 25/11/14: NATS Investigation Report received. CAA Closure: Operator advised that investigation identified failure of a crankshaft oil seal as the prime cause of event. Root cause of the failure could not be identified, but the engine had a reported history of oil leaks. Aircraft and engine were subsequently sold and withdrawn from service, therefore no further investigation practical.
201409968	23/07/2014	Take-off	EGBJ (GLO): Gloucestershire		EGTT : London (FIR)	OTHER	Reciprocating	1	PAN declared due rough-running engine.	The events described have not been checked for accuracy against the relevant RT recordings. The pilot declared a PAN due rough-running engine while on climb out having departed Runway 04 northeast-bound. Full emergency action initiated. The pilot elected to fly a short circuit and landed Runway 04 safely. External services not called for due to the short duration of the incident, and the aircraft taxied back to parking without assistance. The pilot subsequently phoned to advise a suspected vapour lock caused the engine trouble.
201410409	31/07/2014	Take-off	EGSS (STN): London/Stansted		EGTT : London (FIR)	ATR	Turboprop	2	MAYDAY declare due to engine failure after take-off. Second aircraft broken off approach to allow emergency aircraft priority landing.	I was the AIR controller. The aircraft was cleared for take-off and appeared to depart normally. When I instructed the aircraft to transfer to 118.825 I was told to standby. The Captain then declared a MAYDAY reporting an engine failure after take-off and requested to return to Stansted. I asked him if could he accept radar vectors to land on Runway 22 or did he require an immediate return. He stated he could accept vectors, he required to hold for 5-10 minutes to complete his checklists. I asked if he could accept a frequency change and he said yes. All departures were stopped, Check All in force. The runway was inspected and declared serviceable. The Watch Manager requested all arrivals to be stopped so one aircraft was broken off approach. The aircraft landed normally at 2011, vacated at LR and did not require further assistance. The runway was declared serviceable and the Captain contacted the Fire Service on 121.6 when on Taxiway Hotel. Full Emergency cancelled at 2014. Supplementary 31/07/14: Aircraft on departure experienced an engine failure. The aircraft was transferred to Director after coordination with the Tower. The aircraft informed me that he had shut down the engine and, after completing his checks, would like to return. He anticipated a normal approach and landing. Second aircraft was broken off the approach at the Tower's request and, after a slight delay, vectored back round to land ahead of the emergency traffic.
201410409	31/07/2014	Approach	EGSS (STN): London/Stansted		EGTT : London (FIR)	BOEING	Turbofan	2	MAYDAY declare due to engine failure after take-off. Second aircraft broken off approach to allow emergency aircraft priority landing.	I was the AIR controller. The aircraft was cleared for take-off and appeared to depart normally. When I instructed the aircraft to transfer to 118.825 I was told to standby. The Captain then declared a MAYDAY reporting an engine failure after take-off and requested to return to Stansted. I asked him if could he accept radar vectors to land on Runway 22 or did he require an immediate return. He stated he could accept vectors, he required to hold for 5-10 minutes to complete his checklists. I asked if he could accept a frequency change and he said yes. All departures were stopped, Check All in force. The runway was inspected and declared serviceable. The Watch Manager requested all arrivals to be stopped so one aircraft was broken off approach. The aircraft landed normally at 2011, vacated at LR and did not require further assistance. The runway was declared serviceable and the Captain contacted the Fire Service on 121.6 when on Taxiway Hotel. Full Emergency cancelled at 2014. Supplementary 31/07/14: Aircraft on departure experienced an engine failure. The aircraft was transferred to Director after coordination with the Tower. The aircraft informed me that he had shut down the engine and, after completing his checks, would like to return. He anticipated a normal approach and landing. Second aircraft was broken off the approach at the Tower's request and, after a slight delay, vectored back round to land ahead of the emergency traffic.
201410505	02/08/2014	Take-off	EGLL (LHR): London/Heathrow		EGTT : London (FIR)	UNKNOWN	Turbofan		MAYDAY declared due to engine malfunction. Engine shutdown and aircraft returned after dumping fuel.	At the time of the incident I was the controller on TC NW. Aircraft departed on a WOBUN departure and was transferred to me climbing to 6000 feet in accordance with the SID. When the aircraft was just south of BNN, the pilot declared an emergency stating he was shutting down the right hand engine. I asked if he was declaring a MAYDAY to which he replied in the affirmative. I asked the pilot to squawk 7700 which he did. As the aircraft was passing about 5400 feet, he stated he wanted to descend to 5000 feet which was approved when the traffic conditions allowed and return. I asked the pilot if he wanted to return immediately or hold somewhere, to which he replied he wanted to make an approach straight away. Co-ordination was effected with airfield. Subsequently the aircraft elected to hold to dump and burn fuel.
201410909	03/08/2014	En route	EGBJ (GLO): Gloucestershire		EGTT : London (FIR)	BELL	Turboshaft	1	Engine out warning light.	A standard 28 day company check flight was to take place for 2 private pilots. 3 persons on board, 1 instructor pilot and 2 PPL pilots. Instructor pilot flying from The left front seat & PPL in the right front seat, 2nd PPL occupying the far right rear seat. A normal start up was made with all checks in place, pre take off and post take off checks completed. The aircraft was taxied and dewed for a circuit based on 22 right hand. The aircraft was flown into the circuit where the instructor advised the pilot that a simulated hydraulic failure was to take place as previously briefed. The PPL demonstrated a satisfactory landing running on to the ground without hydraulic assistance. On the ground, hydraulics were restored. Pre take off checks completed and a lift into the hover was made. As previously briefed by the instructor a simulated engine failure from the hover was accomplished to a satisfactory standard by the PPL. A clearance for a departure to a private site was then made and consequently granted by ATC. The aircraft then departed into wind based on the 22 circuit. Once clear of the circuit the helicopter began a climb to the cruise at 1900ft QNH 1008 where a number of warning light actions were discussed between the instructor and the pilot to assess the knowledge of the pilot. A suitable area was picked out by the instructor and as briefed, checks were completed and a basic autorotation was performed to a powered recovery with no abnormalities. The aircraft was then flown to 1900ft abmsl for a practice forced landing drill. Checks were once again completed by the instructor and the verbal warning "practice engine failure go" was announced. The Instructor rolled off throttle from the left side and the pilot reacted appropriately entering autorotation, shortly after the ENG OUT warning light illuminated at which point the instructor immediately resumed control. With the aircraft established in autorotation and a landing site selected the instructor successfully made an in-flight engine restart and climbed to a recovery. A safe landing was made at the destination. CAA Closure: No further action.
201411861	24/08/2014	Take-off	Lleweni Parc Airfield,		EGTT : London (FIR)	TECNAM	Reciprocating	1	UK Reportable Accident: Aircraft impacted runway after engine failure on take-off. One POB, no injuries reported. Aircraft substantially damaged. Subject to AAIB AARF investigation.	CAA Closure: The aircraft's engine failed shortly after takeoff, following which the aircraft stalled. The pilot was unable to recover from the stall before the aircraft struck the ground close to the departure runway, causing damage to the aircraft's propeller, landing gear and fuselage spaceframe. AAIB Bulletin 12/2014, Ref: EW/G2014/08/09.

201412081	30/08/2014	En route	EGDG (NQY): St. Mawgan		EGTT : London (FIR)	DE HAVILLAND	Turboprop	2	PAN declared and aircraft returned due to engine malfunction. Nr1 engine shut down in flight.	Aircraft declared PAN with an unspecified engine problem, requests to land back at departure airport. A/C requests to route to the hold. A/C cleared to the hold and descended to altitude 3000 ft on the QNH. A/C establishes in the hold and advises that they have shut down No. 1 engine. A/C is then vectored for a 15 mile final on the ILS to runway 30. A/c landed safely.☐ Supplementary 30/08/14:☐ On passing approximately FL085 the No 1 engine made what sounded like surging noises. Within about 5 seconds of the first abnormal sound a #1 PEC caution appeared on the Caution/Warning Panel. On checking the Engine Display it was clear that the No 1 engine was overspeeding but had been controlled by the Overspeed Governor. The No 1 power lever was slowly retarded by the PF (FO) and the aircraft was levelled off and a PAN declared. The PF assumed the radio duties and the PNF addressed the QRH for the relevant caution. The QRH actions were carried out (including selecting the Alternate Feather switch on) and as the propeller had feathered the engine was subsequently shut down. The FO remained the PF and requested vectors for a return to the hold and descent. The Captain subsequently briefed the SCCM using the NITS format, and made a PA to the passengers reassuring them that although this was a very rare occurrence the aircraft was very capable of flying on a single engine and also that all pilots are rigorously trained for this specific scenario. After confirming that all the QRH actions had been completed, with the single engine approach and landing threats briefed and the standard descent and approach checks completed we departed the hold for the ILS approach. On leaving the hold the Captain took control as PF. The final approach commenced from a platform altitude of 2500' and the autopilot was disconnected before the final descent on the GS. The approach and landing were uneventful, and the aircraft was taxied to a remote stand in the normal manner. ATC were very helpful without being intrusive during the more busy parts of the incident. Once all of the passengers had disembarked and a suitable time had passed for a "cool down" period, the Captain debriefed the cabin crew on how it had gone for them and how the passengers behaved. The CC were exemplary and reassured individual passengers that were showing signs of anxiousness. ☐ CAA Closure:☐ No1 engine propeller control unit and no1 beta feed transducer found defective, no1 engine propeller control unit and no1 beta feed transducer replaced. (replacement beta unit post mod standard). Function checks and ground runs accomplished satisfactory. Pre mod beta feed transducers (BFT) have a known reliability problem. Post mod transducers reliability are much improved. the operator is currently in a modification program to replace pre mod units.
201412938	13/09/2014	En route	Midhurst		EGTT : London (FIR)	AVID	Reciprocating	1	UK Reportable Accident: Aircraft suffered engine failure and made forced landing in a field. One POB, no injuries reported. Subject to AAIB AARF investigation.	
201412938	13/09/2014	En route	Midhurst		EGTT : London (FIR)	OTHER	Reciprocating	1	UK Reportable Accident: Aircraft suffered engine failure and made forced landing in a field. One POB, no injuries reported. Subject to AAIB AARF investigation.	
201413069	16/09/2014	Take-off	EGHH (BOH): Bournemouth/ Hurn		EGTT : London (FIR)	DASSAULT	Turbofan	2	PAN declared due to loud bang heard from RH engine control unit. Aircraft returned.	Aircraft departed runway. A loud bang was heard just before rotation but continued its take off and climbed it then called a pan pan and routed out to the coast to commence the checklist and burn fuel. During this time it remained on the tower frequency of 125.6. The aircraft reported that it had an engine failure. A full emergency was called on report of the pan pan, a runway inspection was carried out whilst the aircraft was at the coast. The aircraft landed safely on a single engine at 10:12 and was able to vacate the runway and taxi back to its apron the pilot reported that he suspected a bird strike but after further runway inspections the safety team reported that no bird remains were found and that the bird strike is unconfirmed, the pilot reported that the possible bird strike occurred in the last third of the runway but the bang was heard in the second third of the runway.☐ Supplementary 16/9/14:☐ Shortly after Vr the RH ECU went "bang" and ran down to 70% N1 whilst showing normal oil pressure and temperature. The aircraft was stabilised at 160kts. Immediate actions carried out and the aircraft climbed away. A PAN was declared. Well before 1000ft, the nominated Ha for departure, the RH ECU slowly accelerated to full power. A normal twin engine full power climb was continued to 1500ft where power was reduced from take-off power to climb power. At this point the RH ECU once again went "bang". The RH throttle was then reduced to idle. The crew positioned the aircraft at 2000ft to consider the situation. It was elected to keep the RH ECU running at idle and prepare the aircraft for a single engine arrival back. Visibility had improved to 8km, so following consultation of both normal and emergency checklists, the aircraft positioned for an 8nm VFR approach from 2000ft.The aircraft landed without further incident.☐ CAA Closure:☐ Engine was sent to the engine shop for repair. Report found the bleed valve rigging to be slightly out of limits, removal of the top case reveals several stages of the blades and stators coated with organic residue, thought to be bird remains. Combustor and two fuel nozzles found coated with organis residue. Nozzle guide vane distorted and burnt in one location. Sample of the residue being sent for analysis.
201413197	17/09/2014	En route	Stoke on Trent		EGTT : London (FIR)	EUROCOPTER	Turboshaft	2	Engine shut down and aircraft returned due to engine chip warning. Engine restored for landing.	En route a task when the No1 Engine Chip Amber Caution illuminated. "Fuzz Burner" activated but the caution remained. Aircraft returned to base on one engine and in light of the warm calm conditions, I elected to restore no.1 engine for the landing. The aircraft had only flown 1:20 post a double engine change with both engines newly overhauled. Engineering assistance sought on return to base.☐ CAA Closure:☐ Build debris from new engine. NFA.
201413499	17/09/2014	Take-off	EGTW : Oaksey Park		EGTT : London (FIR)	DE HAVILLAND	Reciprocating	1	MAYDAY declared due to rough running engine.	Shortly after take-off the engine (at full power mixture rich, carb heat hot) suddenly began to run very roughly. Engine instruments showed no problem. Both magnetos individually isolated to no avail. At reduced power vibration reduced however full power required to return for precautionary landing. Declared mayday. Elected to land at intended destination.
201413504	27/09/2014	En route	Nr Warrington		EGTT : London (FIR)	CESSNA	Reciprocating	1	UK Reportable Accident: Engine failure, forced landing in a field. Damage: Substantial. AAIB AARF investigation.	CAA Closure:☐ The aircraft suffered a sudden and significant loss of engine power during the cruise portion☐ of the flight. The pilot identified a field for a forced landing, but the aircraft struck trees at its☐ near boundary and stalled, dropping into the field of intended landing. The pilot thought the☐ most likely cause of the power loss was a restriction in the fuel supply to the engine. An engineering inspection of the engine revealed that the number 3 cylinder rocker cover☐ had been punctured from the inside outwards by the inlet valve rocker arm. From the lack of☐ impact deformations on the rocker cover, it was concluded that the damage occurred before☐ the final accident sequence.☐ When the engine core was disassembled, it was found that the number 3 cylinder inlet☐ valve had dropped into the cylinder. On removing the induction system, a piece of broken☐ valve head was found within the tube that led to the number 1 cylinder induction valve,☐ partially blocking the tube. Detailed inspection of the number 3 cylinder and the dropped valve confirmed that the upper valve spring retainer had fractured in half, causing the valve to drop into the cylinder and☐ contact the piston. This caused the valve head to fracture into three large pieces. One of☐ the pieces stayed attached to the valve stem, the second became jammed within the valve☐ seat in the cylinder head, and the third was found within the induction tube of the number 1☐ cylinder. Other smaller pieces were observed to have been liberated from the valve, some☐ of which were most likely to have been drawn into the number 2 cylinder, causing damage☐ to the piston before being ejected through the exhaust system.The loss of engine power was thus attributed to the failure of the upper spring retainer of the number 3 cylinder inlet valve, which led to the valve dropping into the cylinder. With one☐ cylinder compromised, there would have been a significant loss of power which, along with☐ partial blocking of the number 1 cylinder induction system and minor impact damage to the☐ number 2 piston, would have meant that there was insufficient power for sustained flight.
201414192	29/09/2014	Approach	EGBG : Leicester		EGTT : London (FIR)	OTHER	Reciprocating	1	Partial engine failure due to plasma (magneto) failure. PAN declared.	On approach the aircraft yawed to the right with a loud bang at 30-50ft AGL. Inspection of instruments showed a power indication of 118% twice that normal expected and a rate of descent of 100-200ft/min. Realising insufficient power to maintain hover, at a height of 10-20ft AGL over RW10 I called PAN whilst manoeuvring the aircraft over the grass parallel to the runway. With a slow descent still in progress I performed a o/o landing onto the grass. During the shutdown process I confirmed a plasma ignition failure through the appropriate checks. After the shutdown inspection of the aircraft showed no obvious damage or injury to persons.
201414441	15/10/2014	En route	En route		EGTT : London (FIR)	BRITTEN NORMAN	Turboprop	2	PAN declared and aircraft diverted due to flames observed from Nr1 engine.	Whilst operating as the combined East Bank Tactical and Planner I received a call from aircraft declaring "PAN PAN, PAN PAN, PAN PAN". I then requested the aircraft pass his message and was informed that the flames had been observed coming from the left hand number one engine and as such a precautionary shut down of the engine had been performed. The aircraft requested vectors for a diversion and I issued a heading instruction of 220 degrees. I then called approach to inform them of the issue and also informed my LAS of the PAN call. With my LAS in attendance on the sector I placed the RT on speaker and confirmed with the aircraft which engine had been shut down, what length of final approach was required and if an approach for runway was being requested as other runway was in use for landing. The pilot confirmed the number one engine shut down, that he would take an approach for either runway and a minimum 7nm final was required. This information was passed to radar. The aircraft was observed descending from the cleared level of FL80 but I did not think it a priority to question this before the aircraft requested descent. I issued a descent clearance to 5000ft (there were no pending departures on either bank) and passed the QNH. This clearance was also passed to radar and then the aircraft was transferred to their frequency after checking the pilot was happy to take a frequency change. After working radar the aircraft landed safely and vacated the runway.
201414988	16/10/2014	En route	En route		EGTT : London (FIR)	EUROCOPTER	Turboshaft	2	Loud bangs from aircraft after No1 engine selected to idle during double engine failure practice.	Aircraft in cruise flight 3000ft AMSL, 120Kt IAS, set up for practice double engine failure, which involves selecting first no1 engine ECU then the No2 engine ECU to idle. On selecting no1 ECU to idle loud bangs heard from the rear of the aircraft. All cockpit NR and VEMD indications normal as expected. ECU reselected to flight . Aircraft RTB without further incident on landing. Aircraft declared unserviceable. Port engine examined and the engine manufacturer have reviewed the the results. The aircraft is awaiting an engine change.

201415619	06/11/2014	En route	En route		EGTT : London (FIR)	ATR	Turboprop	2	PAN declared and aircraft diverted due to engine Nr2 "Propeller Brake" Master Warning activation.	Aircraft declared a PAN with engine problems. The a/c decided to divert and then changed his mind and went to another airport. The a/c stated he was going to shut down and then re-start an engine. This did not rectify the problem and the engine was subsequently shut down. During these events the sector was split and the emergency aircraft remained with the initiating controllers. The a/c landed safely.☐ Supplementary 06/11/14: In the cruise inbound at FL170 when "Prop Brk" Master Warning activated. QRH consulted with In Flight actions being to continue normal operation and monitor Engine 2 parameters. Diversion back requested for maintenance input. As aircraft commenced turn back, aggressive fluctuations but short in duration commenced on Engine No.2 parameters with associated yaw and noise. The fluctuations were always associated with the "Prop Brk" Master Warning which was cycling on and off. PAN declared and immediate descent requested in order to reduce power settings and diversion requested. With QRH not providing any further guidance, crew agreed that as the problem appeared to be being caused by the Prop Brake an attempt should be made to de-energise the Prop Brake prior to the option of shutting the engine down. Prop Brake "Pwr Sply" and "ClI & Ind" circuit breakers identified by the crew and pulled. Engine fluctuations and Prop Brake Master Warning ceased. Requested delaying vectors to have a review and consider options. Approx. 5 minutes later a small and much less pronounced fluctuation was experienced and the decision made to immediately divert, monitoring for further fluctuations and consider a shutdown of Engine No.2 should any further fluctuations or complications be experienced. No further fluctuations observed. After landing uneventfully, PAN downgraded and aircraft taxied to stand. Precautionary thermal inspection requested from the Fire Service once parked on stand to ensure it was safe for the passengers to remain on board, which revealed no hot spots. Tech Log entry made. During downwind vectors "Anti Icing" Caution illuminated along with "Alpha" Local Alert on F/O "Probes Htg" (overhead panel). Once again, the Cabin Crew commented that communication between them was made extremely difficult due to there not being a second interphone at the Cabin Crew forward station on this aircraft. This is a recurring theme on this aircraft in abnormal situations.
201415749	09/11/2014	Take-off	EGHI (SOU): Southampton		EGTT : London (FIR)	DE HAVILLAND	Turboprop	2	MAYDAY declared due to fire from landing gear.	Aircraft had backtracked runway 20 for departure and had been cleared for take-off. Soon afterwards the pilot later stated "there's an issue in the cabin" which I acknowledged. There was no reason to cancel the take-off clearance and I watched the aircraft and everything appeared normal.☐ The aircraft was observed moving forward, indicating the aircraft was commencing it's take-off run when the pilot transmitted "PAN PAN PAN" after:☐ having moved approximately 200 metres. The PAN was acknowledged with information passed from the pilot reported as smoke from the port undercarriage. The pilot intended to vacate the runway so I instructed him to vacate on taxiway B, with the intention to hold the aircraft at B1. Whilst this was happening I initiated a 'Local Standby Ground' via Omni Crash and I was half way through the message when I could see flames from the undercarriage. I remember stating "I can see flames - I'm upgrading" which the SIAL Ops Duty Officer acknowledged. The aircraft came to a halt on the runway between V2 and taxiway B. I'm not sure whether this was because of my transmission or whether the pilot could see the flames. I immediately selected the 'Full Emergency' on the Omni Crash and re-commenced the passing of the message using the 'Aircraft Ground Incident' classification. The pilot of the aircraft was trying to obtain information regarding the situation outside, whilst I was passing the content of the message.☐ I am aware that the message was disjointed as the RFFS vehicles were now on frequency requesting permission to enter the runway which was☐ approved. Two major vehicles entered at V2 whilst Fire 1 and another major vehicle entered at B1. Aircraft was instructed to contact Fire on 121.600MHz following a request from Fire 1. Fire 1 notified the no RFFS Category available, which I acknowledged. I obtained Fire 1's permission to tow an aircraft, that had pushed back from stand 2, back onto stand 2 after permission from Ops had been obtained. ☐ Supplementary 9/11/14:☐ Aircraft Ground Incident declared due to smoke issuing and fire observed from port undercarriage. Aircraft located on runway 20 having just commenced take-off roll. AFS attended scene and downgraded incident to Local Standby. Passengers disembarked on runway and into coaches and aircraft recovered from runway and parked on stand. Airfield Operations suspension lifted following full runway inspection. Airport Authority has conducted initial wash ups and will review any agreed actions. These will relate to the response and recovery of the incident and not as suggestions to prevent as this is being dealt with by the aircraft operator.☐ Supplementary 9/11/14:☐ At the end of the backtrack before takeoff, during the turn to line up, SCCM contacted the flight deck to report the cabin not secure. Held position. SCCM then reported a passenger had observed smoke emanating from the LH Main wheel. Commenced taxiing forward to vacate runway and made 'PAN' call at that point; SCCM then contacted again to report fire at the main wheel. Stopped on runway. Put out 'mayday' call. Shut down both engines. Put cabin crew to 'standby'. Elected to await fire crew for detailed observation (approx 30s). Fire crew on 121.6 advised safest course of action to keep passengers aboard. Fire crews deployed hoses, but did not discharge. Eventually, engineers attended and reported a failure of the #2 main wheel bearing resulting in the disintegration of the brake unit. It was deemed safe to disembark the passengers onto buses on the runway before the #2 wheel was removed and the aircraft towed onto stand.
201416034	14/11/2014	En route	En route	SUNOT 57N30W	EGTT : London (FIR)	LOCKHEED	Unknown	4	PAN declared and aircraft returned due to loss of nr4 engine.	At time 0944 the aircraft declared an emergency and advised that they were shutting down number 4 engine and requesting to return to departure airfield. Aircraft descended to FL210 and from present position routed direct. No traffic to affect.
201416247	19/11/2014	En route	En route		EGTT : London (FIR)	BOEING	Turbofan	2	Spurious engine surge EICAS messages leading to a single engine landing.	During cruise a L EEC status message was received. Upon descent an 'ENG SURGE L' EICAS message was displayed momentarily. Upon intermediate level off the message was seen again with a TPR increase rapidly of about 10%. Message cleared and shortly thereafter message reappeared. QRH checklist actioned. Engine treated as unreliable and left at idle power. Single engine approach and landing completed into LHR. Noted from history that there were five previous occurrences of EEC status messages. ☐ The message was triggered by the control system misinterpreting the multiple oscillations of P30 validated signals due to freezing of the capillary tubes in the pressure transducer module within the Engine Electronic Controller. Evidence is provided by both flight data analysis and review of the maintenance messages on the portal. Engine OEM instructs periodic draining of the PTM via a vacuum pump aligned with the P30 draining task (100-250 FC depending on engine mod standard). This has been implemented. the OEM is also working on a major P30 line redesign to get rid completely of the moisture/water related issues. Scheduled maintenance introduced.
201417213	11/12/2014	En route	EGXC : Coningsby		EGTT : London (FIR)	EMBRAER	Turboprop	2	MAYDAY declared due to engine fire. Fire was extinguished, engine shut down and aircraft diverted.	Aircraft declared MAYDAY whilst climbing to FL270 and stated he was descending to FL120. By the time I phoned TC cap to notify them he was already squawking 7700. Asked them if FL120 was ok they said yes. Pilot stated it was an engine fire as I was on the phone. TC cap phoned TC south and came back to me to tell me their frequency. The pilot asked to be diverted to a nearby airfield and my TAC put him on an appropriate heading. Coordinated again with TC and s17. The pilot then informed us that the fire was no more that they had shutdown n0.2 engine and would like to divert to an alternative airfield. After coordination with TC and s17 the a/c was transferred to 128.425
201417572	15/12/2014	En route	EGHH (BOH): Bournemouth/Hurn		EGTT : London (FIR)	DIAMOND	Reciprocating	2	Engine Control Unit (ECU) A and B failure.	AT FL050 DURING CRUISE, L/H ECU FAILURE CAUTION APPEARED. IT WAS RE-SET AS PER QRH AND CLEARED. APPROXIMATELY 30 SECONDS LATER IT CAME BACK ON, ALONG WITH AN ECU B FAILURE CAUTION. THESE DID NOT CLEAR OR RE-SET. INITIALLY L/H OIL TEMP WAS LOW (OFF THE SCALE) THEN HIGH OIL TEMP WARNING ANNUNCIATED. RETURNED FOR A NORMAL LANDING. L/H ENGINE SHUT DOWN UPON LANDING FOR PRECAUTION. AIRCRAFT SUBMITTED TO ENGINEERING FOR INVESTIGATION.
201417680	18/12/2014	En route	En route		EGTT : London (FIR)	AGUSTA	Turboshaft	2	PAN declared due to engine nr1 and baggage bay fire warning, suspected spurious.	I was ADI when radar called to inform me that aircraft had declared a PAN with engine fire warning no1 engine and the engine had been shut down. A FULL EMERGENCY was declared. Departures were stopped and an inbound VFR aircraft was routed to a VRP to hold. A visual approach was flown and when at approx 5nm to run the Captain spoke to the Fire Commander on frequency to inform him of the situation. The aircraft landed safely and the fire service followed it to shut down on the apron. The incident was terminated and following a runway inspection normal operations were resumed.☐ Subsequently the radar controller informed me that he had monitored frequency and that the pilot thought the warnings may have been spurious.☐ Supplementary 18/12/14:☐ No1 Fire Audio plus associated CAS warning, but no indication on Fire Control panel. Camera checked. Fire warning was thought to be spurious.☐ Camera remained on. Engine left in Flight mode. Warning light on Fire control panel and Engine control panel both illuminated. Following the illumination of both warning lights, and having ensured that safe OEI power was set, the crew elected to follow the QRH drill for Engine Shutdown. Once the No1 Engine was placed in Idle, the Baggage Bay fire warning illuminated with the associated aural warning. Camera was checked, there were no indications of flames/smoke from the baggage bay area. Landing Gear lowered. Discussed the possibility of landing off-airport due to the possible baggage bay fire. Engine No1 shut down (crew reasoned that it could be a hot gas leak, and that this could possibly have contributed to the other warnings). PAN declared to ATC. Aircraft recovered to airport. The Baggage Bay Fire warning light stayed on steadily initially, and the Engine No1 Fire lights flickered on/off on the Engine Control Panel and the Fire Control Panel. Simultaneously the Baggage Bay Fire light, and its associated aural warning illuminated/sounded continuously.☐ CAA Closure:☐ Fault traced to nr1 and nr2 IOMs. Both items (P/N 8G4620V00151) were replaced and programmed. Operational test of both items carried out and terminal block TB379 (P/N A520A02WPN) also replaced as a precaution. Preliminary analysis of the nr1 Input Output Modlie (IOM) highlighted signs of water intrusion. Subject raised of water infiltration in the bay where the IOMs are installed during engine or upper deck washing. Aircraft manufacturer requested test to look for water infiltration into the avionic bay whilst performing engine washing. During the test, which was observed from the aft engine nr1 bay, water was seen entering the LH avionic bay and then down into the lower bay where the IOMs are installed. Root cause determined as improper sealing between the flange and the draining pipe. Sealing was subsequently restored.
201500005	02/01/2015	Approach	EGLC (LCY): London city		EGTT : London (FIR)	ATR	Turboprop	2	MAYDAY declared and aircraft diverted due to engine fire warning during approach.	Call to advise engine fire on approach and MAYDAY declared and diversion. I called ATC to confirm, this was confirmed by ATC. Airport handling called to brief, they called back and said landed on blocks.☐ Supplementary 02/01/15:☐ The initial report of an incident involving one of our aircraft. Initial information is that this was a spurious engine fire warning, the engine was shutdown and the aircraft diverted safely.☐ Supplementary 05/01/15:☐ On final approach at 2200' QNH Engine fire warning and master caution illuminated on engine number 2. Go around procedure initiated at 2000 feet (Maintaining 2,000 ft). Mayday call transmitted and memory actions initiated by Captain, and carried out IAW QRH by First Officer. Fire warning still illuminated 30 seconds after 1st shot, so second shot activated. Fire warning continued for approx 1 minute after second shot, then extinguished. Diversion requested and remaining QRH items carried out. Cabin Crew NITS brief carried out. Briefed about single engine landing, informed that evacuation would not be required, unless told otherwise, and also informed that we would probably vacate the runway after landing and taxi to terminal for a normal disembarkation. A/C control and radio handed over to F/O whilst Captain made PA to passengers informing them of precautionary engine shut down and the requirement to divert. Cabin reported that all Pax seemed calm and unconcerned. Single engine approach and landing carried out without further incident. After landing, Fire crew inspected aircraft from outside and gave permission to proceed to terminal. Aircraft taxied to terminal and passengers disembarked normally.☐ Supplementary 05/01/15:☐ The aircraft was inspected and a half inch crack was found in the high pressure bleed duct on the no.2 engine. This was ascertained to be the cause of the fire warning.☐ Supplementary 02/01/15:☐ At approximately 0825z I was plugged into the ADC position, and had cleared the aircraft to land. When the aircraft was approximately 4nm out, the pilot stated that he was going around. I acknowledged his transmission, then called Radar to coordinate altitude three thousand feet. As I was on the phone to Radar the pilot called a Mayday, engine fire. I acknowledged this, and told the pilot that he could climb to three thousand feet if he wished. I obviously did not want to give the pilot too many instructions or overload him with information. My colleague viewed with binoculars that there was no sign of flame or smoke coming from the aircraft. This was relayed to the pilot over the frequency. The pilot then advised that he wished to divert I told Radar this, and told the pilot to contact them.☐ Supplementary 02/01/15:☐ Aircraft was established on a stable approach to runway 27. At 0827 I was advised that the aircraft was going around, the coordinator then called the tower to advise missed approach instructions but was told the aircraft was declaring an emergency and continuing straight ahead to 2000ft. The aircraft then checked back on frequency with me and was asked if he could accept further climb, the pilot reported he wished to maintain 2000ft and divert. He was turned to the east and told to squawk 7700. Due to the limits of controlled airspace the pilot was informed he would be leaving controlled airspace and a Deconfliction Service would be provided outside unless he could accept a climb, the pilot reported he was happy to maintain 2000ft and accept a DS (no traffic to affect OCAS). The pilot reported 28 passengers and 3 crew and was given vectors downwind right hand for runway 24. The aircraft was handed over to Diversion Radar on 130.775 at 0835 and landed safely at 0848. ☐ Supplementary 06/01/15:☐ At time 0828 APS advise of a potential diversion inbound due to Engine Fire. At time 0830 diversion inbound confirmed and Full Emergency called. Crew confirm no.2 engine fire indication and fire extinguished. 31 POB. At time 0848 aircraft landed. RFFS in attendance. 0859 aircraft on stand. Incident closed.☐ CAA Closure:☐ Upon investigation and with no evidence of fire, it was discovered that the compensated flex slide duct 1552A010000 was leaking and impinging hot gasses onto the fire wire sensing element loop Z480 within the engine bay, causing the fire warning indication to the crew in the flight deck. The duct was removed and replaced with a serviceable item. The component strip report stated that the seals were worn and had hardened over time. As a result of this event a Technical Notice was issued to the engineers instructing them to inspect the compensated flex slide duct and discharge duct in the same area for signs of leakage, looseness and for any seal deterioration on the affected aircraft. The discharge duct was included as a precaution as it can be inspected easily and is of a similar sliding seal/duct arrangement. This particular duct arrangement is limited to the ATR42-500 and the ATR72-500. The ATR42-320 are of a different engine configuration and not affected. By highlighting this event by using the Technical Notice system, engineer awareness of the problem will have been enhanced when they are carrying out any work or inspections in the area. Operator currently monitoring this to see if it needs including in the 3A check which is carried out at every 1500 hours.

201500200	08/01/2015	En route	En route		EGTT : London (FIR)	BOEING	Turbofan	2	PAN declared and aircraft returned following engine shutdown.	Airborne return following Engine shutdown. PAN Call made. Aircraft landed safely. TDM advised / Press Office aware. Service night stopped. Subsequent medical emergency on the ground. Ambulances called. Crew debriefed. ☐ Supplementary 08/01/15:☐ I was working on tactical sector when the aircraft who was at FL360 asked for descent to FL300 due to a technical problem. I gave descent clearance and when he was approaching FL300 I asked if he needed further descent as I would need to check with the sector below. He responded with a request for FL240 which I gave and enquired whether he had an emergency situation. The pilot then declared a PAN and requested to return to departure airport. I told him to turn back on a heading of 170 degrees and when he had time, to give me some information regarding the nature of the emergency.☐ The aircraft was further cleared to FL200 and the pilot informed me that there was an engine failure and he was working through the checklist so couldn't take a frequency change. After a few minutes he asked to go to hold at FL200 and dump fuel before landing. At this point he was able to accept a frequency change and I transferred him to frequency.☐ Supplementary 09/01/15:☐ Engine Surge and subsequent Fail of Left Engine. Passing 32500 feet during climb a Left Engine surge occurred. First occurrence lasted a few seconds with associated Elcas Indications which cleared quickly, second shortly after. Engine surge L actioned. Reports from crew of crew and passenger observation of sparks and flame from left engine. With thrust at idle L EGT remained high and engine Fail L annotated. Eng Fail L actioned. On further review and taking observation of indications and crew reports the engine was considered severely damaged and severe damage eng L actioned. A return was made. Observation of high N3 vibration, Surge, fail and Cabin visual reports supported severe damage assessment. Fuel jettisoned for 11 mins in hold at WCO. Manual flap 20 landing made. Inspection made by fire service on Taxiway before proceeding onto stand.☐ Supplementary 12/01/15:☐ Crew reported No.1 engine surge at FL 330 and sparks visible from tailpipe. SEP procedures actioned and returned. Metallic splatter found in exhaust tailpipe and extensive damage to aft of IP compressor and whole of HP compressor found during boroscope inspection. Engine removed.☐ CAA Closure:☐ The initial borescope investigation identified that the engine had suffered Intermediate Pressure (IP) and High Pressure (HP) Compressor aerofoil damage. The engine was therefore rejected and an engine change carried out. At the time of removal, the engine had accrued 3310 hours and 418 cycles since new and had not completed any prior shop visits. The engine was returned to Rolls Royce for strip and root cause investigation. It has to be noted that in September 2014, the engine had suffered a bird-strike that resulted in an advisory for N2 speed limit exceedence issued by Rolls-Royce Control Data Service. The P20/T20 probe was changed and a borescope inspection was carried out. The inspection identified damage (missing material on the trailing edge tip corner) to the no.14 IP Compressor Stage 1 blade that was acceptable in accordance with the AMM limits. Rolls-Royce also confirmed that CDS could detect an HPC efficiency shift. This resulted in an 'auto-observation' being generated. Root Cause: The 02 module (IP Compressor) was stripped and the analysis suggests that the most likely cause of IPC Stage 1 blade nr 14 trailing edge tip release was the result of a core bird ingestion, causing a dynamic excitation of the IPC stage 1 blades and a tip rub of blade nr 14. Subsequent vibration of the blade aerofoil during normal operation was then considered likely to have driven
201501119	27/01/2015	En route	EGUY : Wyton	5nm E (SIVDA)	EGTT : London (FIR)	BOEING	Turbofan	2	PAN declared due to Number 1 Engine failure.	Concerned aircraft called on frequency and declared a PAN due to number one engine failure. The aircraft was instructed to change squawk and stated that the intention was to land at planned destination. The airport was advised of the PAN. The pilot stated that he was happy to take a frequency change and was transferred to the destination airport.
201502718	05/03/2015	En route	En route		EGTT : London (FIR)	EUROCOPTER	Turboshaft	2	PAN declared and aircraft diverted due to nr2 engine chip warning.	#2 engine chip light illuminated. Aircraft configured for OEI flight and #2 engine set to ground idle. Once level flight achieved #2 engine shut down iaw check list items. PAN declared and aircraft rerouted. Diversion ATC contacted with no response. Air to ground contact made with aircraft in diversion circuit and information received that airfield closed. Commander elected to fly aircraft to alternate 2 due to the extended facilities available there. Prior to landing #2 engine re-started normally iaw checklist to facilitate landing. Aircraft landed normally at holding point A7 east of runway 20 threshold. Airfield Fire service in attendance. Aircraft shut down normally and passengers/crew left aircraft with no injuries. Chip detectors checked with advice from engineering base and debris removed from oil reservoir chip detector. Chip (biggest) kept for analysis. Aircraft ground run and hovered with no illumination of light. Aircraft then flown back to base.
201503094	10/03/2015	En route	EGHH (BOH): Bournemouth/ Hurn		EGTT : London (FIR)	PIPER	Reciprocating	1	Complete failure/detachment of exhaust pipe from flange and from heat exchanger unit.	Solo PPL student. VFR Navigation Exercise. The pre-flight inspection for this the second flight of the day, was conducted by the student & his Instructor when all appeared in order. The Checks prior to departure and the engine parameters during the departure were considered 'normal'. Took-off RW08 12:23, left turn, heading 290 to depart the CTR. Reported leaving the Zone, conducted FREDA and full power checks to climb to 3000ft planned cruise altitude. On applying full power, the engine suddenly began producing a loud, rough running and rattling noise. Power was immediately reduced and the aircraft was turned 180 degrees to head back to the Airport. During the power reduction, the symptoms seemed to lessen but returned as the power was gently increased to reach salvation. Declaration of an emergency for priority landing was not made, on which point the student was subsequently debriefed on the relevance of this. The symptoms continued throughout the remainder of the flight which is recorded in the Technical Log as having lasted for 25 minutes airborne and also during subsequent taxi to vacate the runway. Post flight inspection revealed the RHS rear exhaust manifold riser pipe had fractured and become separated from its flange still bolted to the exhaust port of the cylinder, thus resulting in uncontrolled hot gas breakout within the engine compartment. Approx half the line of breakage (see photos) appeared 'fresh'. The pipe was also completely loose at the other end where it entered the Heat exchanger below the engine. Components appeared worn out, rusty and corroded. The cockpit CO2 detector had not darkened to indicate noxious fumes and from discussion with engineering it is believed that there was no likelihood of this via the heater/defroster system. A bolt was missing from another exhaust flange. Engineering prepared and fitted a replacement exhaust riser pipe and released aircraft back in to service today. Information regarding when 'new' parts are required for such an occurrence would be appreciated. Details of occurrence will be disseminated in the March 2015 Flight Safety Memo calling for particular attention to these areas by flight crews during pre-flight inspections.
201504154	01/04/2015	Approach	Wadswick		EGTT : London (FIR)	ZENAIR	Reciprocating	1	Rough running engine on downwind approach.	Landed without incident on runway. On further inspection port carburettor had partially disconnected from engine due to crack that developed in the rubber socket.
201504771	04/04/2015	Take-off	EGBE (CVT): Coventry		EGTT : London (FIR)	PIPER	Reciprocating	1	PAN declared due to rough running engine.	After completing 5th touch and go called PAN with rough running engine. Full emergency initiated and aircraft offered runway 8 or 23. Aircraft elected runway 23 and positioned and landed safely. Aircraft vacated runway and shutdown.
201504807	15/04/2015	Take-off	Sutton Meadows, Cambridgeshir e		EGTT : London (FIR)	CYCLONE AIRSPORTS	Reciprocating	1	UK Reportable Accident: Engine failure after take-off, forced landing and rolled into ditch at edge of runway. One POB, no injuries reported. Subject to AAIB AARF investigation.	
201504837	15/04/2015	Approach	EGFF (CWL): Cardiff		EGTT : London (FIR)	OTHER	Unknown		PAN declared due to nr1 engine shutdown.	Requested VFR along the coast. Aircraft transferred to tower @ 0929z. Seconds later aircraft called on my frequency declaring a PAN - no. 1 engine shut down. 5 POB. Pan was acknowledged, tower informed. Full Emergency declared. PAN advised they could route direct to final runway 30 - number 1. Aircraft re-positions behind to follow company traffic. Radar 2 standby - immediately assisted in co-ordination. Radar ATSA - informed D&D - just in case of Airfield OFF Accident. Aircraft asked his intentions - also to land. 9 POB. Aircraft landed safety @ 0940.
201505255	21/04/2015	Approach	EGLL (LHR): London/Heath row		EGTT : London (FIR)	BOEING	Turbofan	4	PAN declared due to nr2 engine failure.	
201505431	21/04/2015	Take-off	Andreas, Isle of Man		EGTT : London (FIR)	RANS	Reciprocating	1	UK Reportable Accident: Engine failed after take-off. Two POB, no injuries reported. Damage to LH wing and landing gear. Subject to AAIB AARF investigation.	
201505437	27/04/2015	Approach	EGKK (LGW): London/Gatwi ck		EGTT : London (FIR)	BOEING	Turbofan	2	MAYDAY declared due to single engine failure.	I was doing TC SE, banded including BIG, TIMBA, SE LOW and SE COORD as there was no coordinator position open at the time. At approx. 1945Z aircraft checked on to my frequency inbound and with his very first transmission he declared MAYDAY, saying he had single engine failure. He told me to standby so I acknowledged his Mayday, called the GS and continued to run the sector. Another controller came over to take the a/c on a discrete frequency - after 3 minutes or so I asked the pilot if he could take a freq change and he said yes, and from that point on he spoke to colleague on 120.175. I was too busy at that point to over hear anything that he said on loudspeaker but I believe he had decided to hold at TIMBA to work out his problem.☐ Supplementary 29/04/2015:☐ Engines went to idle at top of descent. After a few minutes numerous EICAS cautions and right engine parameters all lower than operating left engine. No thrust increase when thrust lever advanced. Left engine seemed to be in a sub idle mode but with increasing EGT. Left engine shut down from QRH. Single engine landing a with fire service in attendance. Shortly after commencing descent with both engines at idle numerous EICAS caution messages were triggered. These were intermittent and flashed on and off quickly so were difficult to view. The right generator was tripping on and off line as well as the utility buses. On the status page we had "R Engine Speed Card" R Engine Ignition was switched on and Anti Ice selected, this appeared to have no effect. Both Thrust Levers advanced but no thrust increase from Right Engine. All the parameters indicated the engine was operating but at lower values than the Left Engine. We discussed the issue and during this discussion the EGT was seen to be slowly increasing. Due to the increasing EGT and the Speed Card Status Message the engine was shut down. No parameters were exceeded. A Mayday was declared with ATC and they were given a NITS briefing, we were given a discreet frequency and left to deal with the situation. ATC were excellent, we were not bothered with questions or numerous frequency changes which was really appreciated. The Cabin Crew were briefed by the Senior after she had received a NITS briefing in the flight deck. It was agreed we would not tell the passengers as it would be a precautionary landing. We completed one orbit to ensure we were full prepared for the landing. All checks were completed from the QRH. Flap 20 landing and appropriate speed used. Smooth touch down after a normal approach. Autobrake 4 and reverse on left engine. Taxied off runway and were followed in by the fire service. No leaks from engine and nothing found on runway after inspection. During taxi in, PA "Normal Operations" used to inform Cabin Crew we were in control of the situation and there were no issues affecting them after the landing. Fire Services checked the engine with a thermal camera before the jetway was attached and passengers disembarked. None of the passengers made any comment to crew or ground staff.
201505484	28/04/2015	En route	En route		EGTT : London (FIR)	BOEING	Unknown		PAN declared due to engine flameout. Aircraft returned.	was working as S10 + S11 tactical. Aircraft declared a Pan reporting a single engine flameout and requested descent. Descent was issued to FL200.☐ The squawk was then changed to 7700. At this time the crew advised they would advise their intentions as soon as they knew what they would be. The☐ aircraft was instructed that if they wished to stop the descent at any point they could. D and D and Swanwick MI were informed of the issue by LAS E.☐ Scottish control East and Montrose sector were informed of the issue by S10 + S11 planner. I handed over the sector at 0629. The aircraft was then☐ transferred to Scottish Montrose sector at 0635 at which point no decision had been made by the flight crew as to their destination intentions. After☐ transfer to Scottish the aircraft subsequently diverted back.

201506300	11/05/2015	En route	EGTR : Elstree		EGTT : London (FIR)	GRUMMAN	Reciprocating	2	PAN declared and aircraft returned due to LH engine failure.	Whilst plugged in as the LARS North controller, the frequency split, the aircraft called on frequency at 1400Z declaring a PAN PAN. I took the pilots details when he was ready to pass them and instructed the pilot to select 7700 on the squawk. The pilot reported the Port engine had failed, and was diverting back and wanted a radar service. I got the aircrafts POB of 2 and endurance of 2hours 30 mins, and all details were relayed to D&D who gave operational control at 1403Z. I liaised with Radar to get a direct routing back and cleared the aircraft through the CTR as coordinated. The aircraft landed safely. □ Supplementary 11/5/15:□ During a MEP Pre Skills Test Training detail the instructor failed the port engine by turning the left fuel cock to off so that the student could demonstrate proficiency at recognising, controlling and conducting the appropriate drills to contain the situation. At the attempted engine re start the left fuel cock had seized in the off position.□ The port engine was feathered, secured and the starboard engine protection drills were executed. The instructor went through the available options and considerations and decided to recover back as the aircraft was maintaining a safe speed and altitude on the one engine. The estimated endurance was in excess of 2.5 Hrs for a 15 minute flight. A PAN call was made to Radar on 132.80 and the Transponder was set to 7700. A transit through the Control Zone direct. An uneventful asymmetric approach and landing was made. The runway was vacated and the aircraft shut down.
201506394	09/05/2015	En route	En route		EGTT : London (FIR)	VANS	Reciprocating	1	Forced landing carried out due to engine failure.	Aircraft declared a Mayday on 121.5Mhz for an engine failure. The Mayday was acknowledged by the controller and the position of a minor aerodrome with a 1000m grass strip was offered. The pilot stated he was unable to make that and was attempting a forced landing. After that the aircraft was too low for radio communications. The ARCC was informed of the incident. At 1505z another aircraft relayed that the pilot had landed safely both the ARCC and the local police were informed and updated. The pilots mobile number was obtained from the UK reg database and called. The pilot stated he was the only person on board and that both himself and the aircraft were perfectly fine and no further assistance was required.
201507296	23/05/2015	Take-off	EGXU (HRT): Linton-On-Ouse		EGTT : London (FIR)	CYCLONE AIRSPORTS	Reciprocating	1	UK Reportable Accident: Engine failure on take-off. Collided with fence. Two POB, no injuries reported. Aircraft damaged. Subject to AAIB AARF investigation.	
201507441	04/06/2015	Take-off	Over Farm		EGTT : London (FIR)	CYCLONE AIRSPORTS	Reciprocating	1	UK Reportable Accident: Engine failure after take-off. One POB, no injuries. Aircraft destroyed. Subject to AAIB AARF investigation.	
201507494	03/06/2015	Approach	EGMC (SEN): Southend		EGTT : London (FIR)	ATR	Turboprop	2	PAN declared and diversion requested due to engine fluctuations. Engine shutdown.	Aircraft unable to make steep approach due to a technical reason. Diversion requested. Declared PAN descending to altitude 3000ft. Requesting a radar vectored approach ILS. Pilot declared engine shutdown but able to maintain height.□ Supplementary 3/6/15: □ During later part of climb and early portion of the cruise I became aware of an occasional beat in the engine noise. There were no obvious signs on the engine gauges of which engine the sound was coming from. I was highly vigilant of the engine parameters from this point. As we past NEVIL at FL170 small fluctuations were observed in the TQ on the number 2 engine. This was accompanied with variation in engine noise but no perceptible yaw effect was noted. I used the MCT power management position to run the NP of both engines up to 100%. This stopped the fluctuations and we continued in the mode for a couple of minutes. The cabin crew member called the flight deck at this point to ask about the engine noises. I told her that I had changed the engine mode in an attempt to rectify an issue and the problem had eased. Just prior to top of descent I returned the power management selector to the CRZ setting thinking that harmonic condition had been solved. During the descent further fluctuations were observed with an increased amplitude than previous observed. This time with an amplitude of about 10% (5 either side). I asked the F/O run the abnormal engine parameters checklist. After selecting the ATPCS off the fluctuations again reduced in amplitude and the checklist was paused to analyse the outcome. However the fluctuations returned with the same amplitude as before and we continued through the checklist and deselected the EEC. With this turned off the fluctuations again reduced and the checklist was again paused to analyse what was going on. Whilst waiting to see if the engine stabilised I asked the F/O to request a diversion as steep approaches are not permitted with the EEC off. I briefed the cabin crew about the diversion I also warned her at this point that if the problem reoccurred it would be necessary to shut down the engine . We approached 4500ft in the decent towards DET the engine TQ started to fluctuate with much great intensity than before and for the first time the NP was seen to fluctuate from 78 to 88 %NP. The TQ fluctuations grew to be about 20% amplitude and yawing of the aircraft was felt. As per the engine abnormal parameters checklist the number 2 engine was then shut down. Single engine operations QRH actions were then completed as we were vectored.□ CAA Closure:□ In consultation with the propeller manufacturer blade trunnion sleeves were found worn and replaced IAW M.M.61-13-12 repair 4.13. It was found that due to wear, ribbing of the sleeves had taken place. The right Propeller assembly was also checked and all blades were found to be within limits. There is no scheduled specific inspection for these sleeves in the ATR MPD. The backlash check that proves blade trunnion sleeve wear is within limits, will now be carried out at five hundred hour intervals and aligned to 1A checks for the operators fleet.
201508308	16/06/2015	Take-off	EGMD (LYX): Lydd		EGTT : London (FIR)	CESSNA	Reciprocating	1	PAN declared due to loss of engine power during climb out. Aircraft landed safely.	FULL EMERGENCY INITIATED IN RESPONSE TO A PAN DISTRESS CALL FROM INSTRUCTOR IN TRAINING FLIGHT. NATURE OF PROBLEM REPORTED AS LOSS OF ENGINE POWER DURING CLIMB OUT, TURNING CROSSWIND IN THE TRAFFIC CIRCUIT. PILOT ELECTS TO LAND ON RUNWAY IN USE (03) PERFORMING A LOW, TIGHT CIRCUIT (RIGHT HAND) AT APPROX 500 FT AGL. LANDING IS EXECUTED SAFELY. AIRCRAFT TAXIED ONTO STAND AND SHUT DOWN. □ Supplementary 16/6/15: □ FURTHER TO THE REPORTED POWER LOSS GROUND RUNS WERE COMPLETED AND IT WAS NOTED THAT THE MAX RPM WAS UNOBTAINABLE AND THE ENGINE WAS RUNNING ROUGH THROUGHOUT THE RPM RANGE. THE ENGINE WAS INSPECTED WITH NO FAULTS EVIDENT. THE SPARK PLUGS WERE SERVICED AND MAGNETO TIMING CHECKED SATISFACTORY. A FURTHER GROUND RUN WAS COMPLETED WITH NO CHANGE BEING NOTED. THE CYLINDER ROCKER COVERS WERE REMOVED AND IS WAS NOTED THAT, ON TURNING THE PROPELLER, CYLINDER #3 EXHAUST VALVE DID NOT APPEAR TO BE OPENING FULLY. CYLINDER #3 WAS REMOVED AND IT WAS NOTED THAT THE EXHAUST CAM LOBE WAS VISIBLY WORN. THE ENGINE WAS REMOVED AND SENT FOR INVESTIGATION. CAM LOBE WEAR WAS CONFIRMED ALONG WITH CRANKSHAFT BEARING JOURNAL WEAR AND THE OWNER / OPERATOR OPTED TO OVERHAUL.□ THE ENGINE. NOTE - THE AIRCRAFT HAD DONE 3.5 HOURS SINCE THE ANNUAL INSPECTION DURING WHICH TIME ENGINE MANUFACTURER(OIL FILTER INSPECTION) WAS SATISFIED AND NO UNUSUAL METAL CONTENT WAS NOTED. THE GROUND RUNS POST ANNUAL WERE NORMAL.
201508393	21/06/2015	En route	Newport, Isle of Wight		EGTT : London (FIR)	OTHER	Reciprocating	1	UK Reportable Accident: Engine failure, forced landing in field. One POB, no injuries reported. Subject to AAIB AARF investigation.	
201508602	29/06/2015	Take-off	Park Farm		EGTT : London (FIR)	OTHER	Reciprocating	1	UK Reportable Accident: Engine failure after take-off and forced landing. One POB, no injuries reported. Subject to AAIB AARF investigation.	
201508992	05/07/2015	En route	EGCF : Sandtoft		EGTT : London (FIR)	OTHER	Reciprocating	1	UK Reportable Accident: Forced landing in field following engine failure. One POB, no injuries. Damage to landing gear and engine. Subject to AAIB AARF investigation.	
201509024	06/07/2015	En route	En route		EGTT : London (FIR)	AIRBUS	Turbofan	2	Aircraft returned after declaring PAN due to nr1 engine failure.	Aircraft was returning after declaring a PAN call with NOR due to engine issues and requiring a single engine approach. Upon calling on the frequency (at FL310) and confirming that no holding was required - due to the pilot continuing his checks - aircraft was descended to FL280 against traffic. Further descent was acknowledged with a 'Standby'. Approx 20 seconds later, aircraft declared he had an engine failure (shutdown no1 engine) and required immediate descent to FL200. After instructing SSR Code 7700, descend was given to FL260 (against conflicting traffic) with the pilot reiterating the need for descend to FL200 on several occasions. After co-ordinating with TC East, (who were working the conflicting traffic) the aircraft was given FL200. Further questioning confirmed that the engine was surging and the pilot had decided to shut the engine down.□ Supplementary 6/7/15: □ In the climb ECAM msg ENG1 Comp Vane appeared. Initial ECAM actions completed and PRO ABN OEB consulted for further info. Stopped climb at FL310 and entered a holding pattern at GIVPO. Maintrol contacted for advice. TDODAR completed and decision to return. A discussion about the possibility of a Surge/Fail and how to handle was discussed. Declared a PAN with ATC and told to squawk 7700. Started the descent when the Engine surged 3 times with vibration. Had Eng 1 Stall.□ EGT now rising rapidly and briefly exceeded limits before being shutdown. ENG 1 Fail ECAM presented and actioned. Now on a heading of 180 to return via LAM. Ran another TDODAR to confirm situation and a single engine full flap autoland to MLS on 27R. Full stop on runway planned A9E for fire service inspection. Turn into wind and Park Brake set for inspection. Inspection completed and taxi to stand 551 with fire service escort.
201510457	01/08/2015	Take-off	EGKB (BQH): Biggin hill		EGTT : London (FIR)	SUPERMARINE	Reciprocating	1	UK Reportable Accident: Crashed on take-off. One POB, serious injuries. Subject to AAIB AARF investigation.	

201510832	06/08/2015	Take-off	EGXT : Wittering		EGTT : London (FIR)	GROB	Reciprocating	1	MAYDAY declared due to engine failure.	During the MANTAC checks at 2000' , shortly after takeoff, the fuel flow was set to 56l/hr iaw placard. Passing approx 4000', in the climb, the Fuel flow was noted at 65l/hr which is abnormal. The Fuel flow was then observed to smoothly fluctuate between 65 and 45 l/hr. Aircraft was turned for return whilst continuing to climb. Shortly after turn, passing 4800' with full power set, the fuel flow was seen to be fluctuating between 25 and 35 L/hr. The engine began to 'rough run' with associated banging/popping and vibration. Rough running drill carried out iaw FRC with no improvement to engine running. PAN declared with the intention of positioning at 'High Key' for a Precautionary Forced Landing. Engine banging/popping and vibration intensified and at approx 3nm to run to 'High key 'at approx 4000' the banging/vibration stopped suddenly and the RPM decayed to a 'windmill' speed. Having already conducted the rough running drill the throttle was retarded to idle and slowly advanced to attempt restart iaw Engine Failure (Non Mechanical) drill. Engine did not respond but continued to windmill. Engine Failure (Mechanical) drill actioned iaw FRC to ensure engine was safely shut down. MAYDAY declared. With RPM selected to low, 'High Key' position achieved at approx 2700'. Given the relatively strong wind and the height at which 'High Key' was achieved, aircraft Captain elected to leave the RPM at low to improve glide performance. AC landed safely. The Propeller continued to 'windmill until just before touchdown. Aircraft impounded. independent fully SQEP LAE briefed and undertook investigation (technical) on 07 Aug 15. Confirmed EDP had failed, leak from case drain. initial review of aircraft as follows: Engine replacement completed 18 July 15 (Due to TBO) Engine bedding in completed. Engine reported to have stopped on taxi-in on 20 July 15 Engine reported to have ran erratically on 21 July 15. Report of fluctuating RPM 1800-2100 during mag checks on 06 Aug 15 (EGR c/o iaw AMM 71-00. All indications & performance parameters within laid down limits. No evidence of rough running despite prolonged EGR & attempts to induce the same. Unable to reproduce reported defect. □ CAA Closure: □ Failure of the engine driven fuel pump, providing erratic fuel flow. Unit replaced. Defective unit returned to OEM. Root Cause: Quality issue with manufacture of the pump. The manufacturer had already raised a Bulletin instructing replacement of certain suspect units manufactured during 2014, but this unit fell outside the criteria of that Bulletin. It has now been re-issued to extend the scope of units to be replaced. Remedial Action(s) Taken: New Bulletin issued by manufacturer. Operator working to new issue and replacing units as necessary.
201512527	09/09/2015	Take-off	EGBJ (GLO): Gloucestershire		EGTT : London (FIR)	STAMPE	Reciprocating	1	MAYDAY declared due to engine failure. Full emergency initiated. Aircraft landed safely.	
201512535	08/09/2015	Take-off	EGHF : Lee-On-Solent		EGTT : London (FIR)	PIPER	Reciprocating	1	MAYDAY declared due to engine failure with sudden roll to the right. Pilot regained control and the aircraft was landed safely.	As the Air Ground Operator I was about to close the radio watch as per procedure at 1530 UTC. I stayed open for a little longer due to visitors unfamiliar with the airfield were departing. Aircraft took off from RWY05 as standard. The aircraft entered a left turn onto crosswind at normal height and continued to climb. A Distress call was made over frequency for a/c. The pilot reported his call sign and intention of landing immediately for RWY23. I acknowledged the mayday call and imposed radio silence on the frequency. I then called D&D on the landline and informed them that aircraft had issued a Distress call. At this time I was visual with the a/c landing safely on 23 and rolling to taxi to parking. D&D did not scramble emergency services and advised me to ring them back with an update. Aircraft informed me that he had heard a loud bang from the starboard side of the a/c and suddenly rolled left with no control. After 3-4 seconds he had regained control of the a/c and continued to land safely. He also said that he had shut off his electrics on approach but still had a very rough running engine. He continued to shut down safely and cancelled the distress call. He needed no assistance. I cancelled D&D and closed the radio watch.
201513192	21/09/2015	Take-off	EGBB (BHX): Birmingham		EGTT : London (FIR)	EMBRAER	Turbofan	2	PAN declared and aircraft returned. Engine shut down in flight due to low oil pressure warning and zero pressure on gauge.	Low oil pressure warning on EICAS and zero pressure on gauge. Engine shutdown as per QRH, pan declared, returned after extended vectoring to land below Max landing mass. Cabin crew NITS briefing, pax kept informed. Went according to plan.

File number	UTC date	Make of A/C	Location of occ	Headline	Narrative text
201401618	11/02/2014	AIRBUS	LEMD (MAD): Madrid/Barajas	Fumes in the flight deck during climb and on approach.	<p>On climb out, a strong oily smell was evident in the flight deck. After approx 5mins, the smell dissipated and flight crew elected to continue the flight. During final approach passing 4000', the strong oily smell returned. Flight crew donned oxygen until after landing. The landing was without further incident. ATC were informed that the flight crew were on oxygen and had fumes in the flight deck. Since the fumes event occurred at a late stage of the approach the crew did not action the smoke/fumes QRH check list as the priority was to establish communications on oxygen and complete a safe landing. In both cases of fumes the engine anti ice was on and the aircraft being reconfigured with flaps. The Cabin crew informed us that no unusual smells were evident in the cabin during both events. After vacating the runway the flight crew stopped the aircraft to complete the after landing checklist. The flight crew elected to turn the APU bleed on and the fumes cleared. The aircraft was taxied to stand without further incident.☐</p> <p>CAA Closure: ☐</p> <p>This is the first reported event on this aircraft and there had been no recent engine or APU changes. The oil consumption rates were well within limits. Engine runs were carried out up to 51% due to wind conditions and workpacks performed AMM. High power ground runs were performed for 1h10mins but no smells were detected. The troubleshooting was unable to establish the cause of the event.</p>
201400960	22/01/2014	AIRBUS	LSZH (ZRH): Zurich	Strong fuel fumes in galley during taxi.	<p>Aircraft was stationary, queuing awaiting take-off. My 2 colleagues and I experienced very strong jet fumes in galley two. We told Purser, who informed flight crew. It got worse and started to affect my breathing so I had to go on portable oxygen. I was breathless pale, weak. Other cabin crew also had similar symptoms. I felt fit and able to operate directly after taking oxygen.</p>
201400024	02/01/2014	AIRBUS	EGLL (LHR): London/Heathrow	PAN declared on final approach due to fumes in flight deck and passenger cabin.	<p>PAN declared due to fumes in the flight deck, pilots were on oxygen with masks and advised they needed no further assistance. Aircraft landed with no further incident.☐</p> <p>Supplementary 03/1/14:☐</p> <p>Strong smell of oily fumes on flight deck and at rear of cabin. Flight crew and two cabin crew at the rear used oxygen as a precaution. Pan declared at 10nm on finals for 27L. As it happened so late in approach oxygen used but no time to action fumes QRH. Stopped on taxiway and oxygen masks removed. Only a residual smell left. Cabin staff in rear galley reported strong fumes when securing cabin for landing. Crew reported feeling nausea and were instructed to don oxygen masks. Passengers appeared to be unaffected. Both rear cabin crew reported to hospital for medical checks.☐</p> <p>CAA Closure: ☐</p> <p>The APU was removed and sent to the manufacturer for investigation. On initial inspection, black light was used to look for traces of oil in the bleed ducts and for any external leaks. No traces of oil were found. A borescope inspection was carried out looking for internal oil leaks or evidence of there having been oil leaks. Again, no traces were found. The APU was then test run. Black light was used during and after test and there was no evidence of oil in the bleed ducts or external oil leaks. Due to service wear, the APU has been disassembled and inspected. There were no findings after hardware inspection that would point to the APU being the source of the smell in cabin event. The root cause was not determined, however there have been no further reports since the APU was replaced. It was recommended that aircraft be monitored for any further events of this nature.</p>
201402138	21/02/2014	AIRBUS	VHHH (HKG): Hong Kong/Intl	Strong, oily smell on flight deck, crew used oxygen.	<p>On take-off, the flight deck and fwd cabin area was filled with a very strong smell (only) of oil. This was identified from previous experience of this smell. Smell persisted until passing FL220 (about 20 minutes). During climb out the length of time that the smell persisted caused the captain to feel slightly nauseous. Crew oxygen was used by the Captain only and nausea subsided. Returned to normal breathing when smell subsided at FL220. Crew reported that smell very strong in front half of main cabin but not noticeable to rear of cabin Heavy captain on flight deck recognised the smell. Maintrol contacted in cruise and data given on oil quantities which showed engine 2 to be 1.5 quarts less than the other 3 engines which were equal. Engine 2 had been topped up with 1quart during transit. Anecdotal evidence from reviewing AML would indicate that engine 2 has been uplifting more oil than other engines.☐</p> <p>CAA Closure:☐</p> <p>Following the crew reports, physical inspections were completed on the aircraft by Engineering. They were unable to detect any recognisable odour on the aircraft, cabin or flight deck, when they were able to access the areas reported to have had the odour. This was some significant time following the landing. The investigations included engine borescopes, ground running with the Aerotracer, selecting alternate pack, engine and APU supplies at varying temperatures. No odour was noted by the engineers running the engines and APU or the Technical Services engineers present. The Aerotracer detected no sign of known oil or other fumes / odour for which it had been calibrated. The oil consumption and levels of oil during the flight were commented on as it was identified that the number two engine had slightly higher oil consumption / oil uplifts on that specific flight. The oil consumption on this engine has been stable since entry into service and is well within expected oil consumption limits. The engine only stands out as it happens to be the highest value out of all the installed engines. There is no reason that this engine should be any more likely to be the source of the cabin odour. Historically on this aircraft, there had been no reported incidents previously during service and one report following build and testing. The cause behind the pre-delivery event was attributable to extensive ground running, multiple starts and cranks leading to low air / oil pressure seal sealing. As the cabin odour has only been reported once, this ASR has remained open to allow for additional trouble-shooting should further evidence emerge during recent operation. No such evidence has become known. Engineering have been unable to reproduce the odour event or detect residual odour or unusual staining on any part of the aircraft. One small bottle of mustard salad dressing oil was found on the flight deck following the incident. This was unsealed but with the top fastened securely and it was not considered that this item is related to the event, nor was any staining observed in that general area. The root cause could not be determined and no further actions are recommended at this time. Engine Management will continue to monitor all fleets for sources of odour generated by engines and APUs.</p>
201402640	05/03/2014	AIRBUS	En route	PAN declared and aircraft returned due to fumes in flight deck and cabin during climb affecting crew and passengers.	<p>Aircraft outbound called PAN with a strange smell in the cockpit. Pilot stated that he wanted to return to the hold with the intention of returning once he had sorted the problem. Aircraft given right turn to hold, descended and transferred to INT. 10 mins later INT rang to say that the pilot wanted to continue to destination and was transferred to me (again) at FL80. Aircraft was climbed to FL120 on a hdg of 080. As the aircraft passed FL110 approx abeam DET he requested to return to departure airport (again) via BIG with a recurrence of the initial problem. He stated that it was not a PAN situation this time, but that he would like an ambulance to meet the aircraft, as a middle-aged women felt unwell because of the smell. Co-ordination done with INT (again) and aircraft transferred.☐</p> <p>Supplementary 05/03/14:☐</p> <p>Aircraft airborne returned to stand as fumes affecting 6 passengers and 1 crew member, flight returned on full emergency, Ambulance and medical response crews in attendance, ambulance requested that all passengers remain on board with doors closed until medical response team in position approximately 15minutes then doors opened after they spoken with captain, they then allowed the passengers and crew affected off the aircraft checking they were all okay and then gave them the all clear to travel. The flight was subsequently cancelled all the passengers were bussed to terminal building where they were going to be met by passenger group staff to assist them.</p> <p>Passengers cleared by medical team.☐</p> <p>Supplementary 06/03/14:☐</p> <p>Suspected fumes. Approximately 5 mins after take-off the cabin crew reported feeling light headed and feeling "funny". The purser contacted the flight deck and then went onto oxygen with one other. After levelling off at 6000ft and approx 8 mins they reported to the flight deck, feeling better. When climb was commenced again they reported feeling lighted headed and "funny" again. Passengers towards the front of the aircraft started to report a smell too. After the first report and cabin crew transferring onto oxygen aircraft held whilst assessment was carried out. After 10 mins, fumes had dissipated and crew felt well enough to continue, soon after initiating climb, crew reported that fumes had returned and they were back on oxygen. Decision was made to return, where aircraft landed without further incident and with fumes no longer present apart from a brief smell in the flight deck on TR selection possibly de-icing fluid. After arriving on stand, pax and crew were ordered to stay on board by paramedics awaiting the arrival of a hazardous response unit. This took around 30 mins and lead to some passengers becoming increasingly anxious and 2 were eventually put on oxygen. After some discussion we were allowed to 'crack open' the aircraft doors to allow some fresh air in. Had the fumes in the aircraft been persistent, we would not have been able to obey the paramedics and would have deplaned.☐</p> <p>CAA Closure:☐</p> <p>Despite extensive troubleshooting, no source of odour could be identified. The cause of this event is therefore not established. The aircraft returned to service following the event without further report. The OSR reports raised for the same aircraft the day prior to the event describe fuel fumes on pushback. This type of report is not unusual and is commensurate with the aircraft cabin air being exposed to the ramp environment during loading of passengers and freight. Stronger winds moving towards open cabin or cargo doors can exacerbate this type of odour. The incident report for the event on 05-Mar-14 does not include a description of the smell or fumes that were detected by the cabin crew or the location of the affected passengers. This type of information can be very useful in identifying potential sources of an odour.</p>
201403444	21/03/2014	AIRBUS	EGLL (LHR): London/Heathrow	Fumes reported in flight deck. PAN declared.	<p>Flight crew went onto oxygen at TOD. No evidence of fumes in cabin. Landing normal. Engineering investigating and flight / cabin crew stood down. Return service cancelled, aircraft AOG. During initial climb from LHR both fc members thought they could detect an unusual smell described as oily or wet dog like. No adverse ECAM and a conversation with Purser revealed nothing in cabin. Climb continued and smell dissipated. Options to return or continue with similar time to landing so flight continued. Approaching tod the situation was reviewed and fc could not positively say that smell had gone in fact periodically each pilot considered a strong smell was present. Due unknown nature. AFS inspection with nothing found.</p>
201405007	24/04/2014	EMBRAER	EGLC (LCY): London city	EICAS fail. Fumes on flight deck. Crew used oxygen. MAYDAY declared and diversion initiated. QRH smoke and fumes, source assumed as display unit 3.	<p>I was alerted by the DVR ATSA. On approaching the sector I saw the T trainee writing on the NITS pad whilst her OJT1 acknowledged a MAYDAY. The speaker had been switched on and I heard the CFE pilot, who sounded like he was on oxygen, requesting immediate return and distance to run. I telephoned GS S to alert him with the bare facts and confirmed that the DVR P was talking directly to the TC Coordinator. The aircraft was transferred to a discrete TC fx after ascertaining that he could take a fx change. I informed D and D and told them that the aircraft was now working TC.☐</p> <p>Supplementary 24/4/14: ☐</p> <p>Electrical smoke on flight deck. During climb Eicas display unit 3 failed. Shortly afterwards a strong electrical burning was smelt on the flight deck. CONFIGURATION: A. Thrust: On. Speed brake: Closed. Flight crew went on oxygen. Mayday declared and decision made to divert. Abbreviated dodar. NITS to cabin for normal landing. QRH smoke and fumes, source assumed as display unit 3. Review completed. Normal landing met by emergency service.☐</p> <p>Supplementary 24/4/14:☐</p> <p>Aircraft called on frequency after being transferred from TCse, and immediately called a mayday due smoke in the cockpit and requested immediate diversion. As the DVR/LYD Planner I put my speaker on, called for the LAS, then phoned TC, informing them of the flight and its diversion, a level and discreet frequency was given. This was given to the aircraft and it was transferred.☐</p> <p>Supplementary 24/4/14:☐</p> <p>Aircraft checked in on frequency at FL120 with a MAYDAY, smoke in the cockpit and requesting a diversion into EGKK. My trainee instructed the aircraft to squawk 7700, I then took the r/t. The aircraft was turned onto an initial heading of 245 degrees. The pilot requested track miles, I gave him the distance to diversion airfield followed by an approximation of the track miles. My planner coordinated the aircraft at FL120 with TC. The aircraft was then transferred to TC SE.☐</p> <p>CAA Closure: ☐</p> <p>AAIB now downgraded to 'Non-Reportable' from AARF investigation. No further investigation to be progressed by the AAIB.</p>
201406647	24/05/2014	AIRBUS	EDDL (DUS): Dusseldorf	Pungent oily smell in cockpit and cabin.	<p>On this flight, and the previous outbound flight, an unknown oily smell occurred in the cabin and cockpit. Cabin crew described it as "sweaty dog smell". Occurred both in the climb, 4000ft, CLB Thrust, and again when thrust idle at approx 4000ft on arrival. Takes about 30 mins to clear. Captain donned oxy mask, while an assessment was made of extent and severity. As the smell was slowly dissipating, decided to continue. No complaints from passengers. On return flight, the smell was much less noticeable, but have entered into tech log for history, should it occur again. Tech log showed no history of this event.</p>

201404456	11/04/2014	AIRBUS	EDDF (FRA): FRANKFURT / MAIN	Aircraft returned due to fumes in the flight deck causing flight crew illness. All crew members taken to hospital for tests.	<p>Shortly after take-off the FO (PNF) reported that he smelt fumes. I thought that it was possibly bread in the oven. FO then reported feeling ill. I then noticed the smell and also started to feel ill. Oxy masks donned. Engineers have reported that the vent blower had failed. Oxy masks donned and PAN declared with NITS to ATC. QRH smoke/fumes started but then fumes removal QRH deemed to be more relevant. Radar vectors to runway 07C. Control handed to FO and QRH stopped to focus on approach and landing. Alert call made and NITS briefing conducted. Brief PA made to passengers. Auto approach and auto land planned. Manual landing conducted. Stopped and reassessed on runway, liaised with fire services. Vacated runway and parked at nearby remote stand. Further PA made to passengers. Despite using oxygen at 100% and emergency, we both felt very ill and debilitated. After parking/shutting down we left the flight deck to be attended to by medics. Command was handed to fire chief who liaised with PSR and passengers disembarked via steps. No fumes or illness reported by passengers. ASR filed. Authorities liaised with and report completed. DFCM and duty tech manager contacted. Flight and cabin crew taken to hospital for tests. Flight crew hospitalised for 24 hours observation.☐</p> <p>CAA Closure:☐</p> <p>A review the Post Flight Report for this sector shows a 'Vent Blower Fault' maintenance message. Engineering carried out a smoke inspection iaw relevant task and the smell was isolated to the flight deck and a residual smell around the vent blower fan was identified. The vent blower fan was replaced. On replacing the vent blower fan, it was however noted that there was no sign of damage or burning on the removed fan and therefore the investigation continued. other checks were carried out and both engines and APU were inspected for signs of oil with no contamination found. During all pack/engine combinations the odour was present, and increased in strength at 1.26 EPR. The odour was also present at full hot and full cold temperature selections. At no point were any engine/APU oil, or hydraulic fluid leaks detected. The odour dissipated when APU air was selected and did not return. Investigations now focused on the air conditioning system with both cabin fan air recirculation filters and the avionic ventilation filter cartridge being replaced. The left hand pack condenser and reheater were replaced and swabs taken and routed to Powerplant for analysis. Both packs were purged and inspected and a specific Workpack was then applied to the left engine and left pack combination. The engine was run at 1.26 EPR and a very slight change in cabin air quality was noted which quickly dissipated. The engine continued to run at 1.26 EPR for two minutes and no further smells were observed. When engine power was increased to 1.3 EPR, the odour briefly appeared for five seconds and then disappeared. The bleed delivery temperature was greater than 185 degrees centigrade, with a similar pack outlet temperature and hot air selected on. The engine was run at various settings and through the full range of pack temperatures. The air quality remained good, however on increasing the pack temperature to hot, a brief odour would appear again and quickly dissipate. Applying the Workpack to the right engine and right pack combination produced similar results. However on running the APU and left/right pack combination, no change in air quality was observed. A consultation with Airbus indicated that pollen ingested by the engine into the air conditioning system may have been a factor as this will give off an odour at temperatures greater than 160 degrees centigrade. This may explain why the air quality did not change when running the APU, as this temperature was lower than 160 degrees centigrade. The engines/packs/APU were run for a total of ninety minutes at varying power settings and temperatures and no ill effects on personnel were reported. It is likely that the odour observed was a result of engine ingestion of external contaminant (possibly pollens), which was then dispersed throughout the air conditioning system. It is not possible to confirm or deny whether pollen was the only source of contaminant, but it is a likely scenario based on the fact that pollen will only produce an odour when burned at high temperatures similar to those recorded during the engine/pack runs, yet the smell was absent during runs using the lower temperatures of the APU. Airbus is confident that this is indeed the root cause and have subsequently added 'Ingestion of Pollens' to the list of 'Possible Sources Affecting Cabin Air Quality' in Wise article EngOps-16325.</p>
201408560	28/06/2014	AIRBUS	EGLL (LHR): London/Heathrow	Fumes in flight deck and cabin caused cabin crew illness.	<p>Fumes reported by cabin crew and noticed on flight deck after takeoff. Fume smell gradually disappeared. Descending through approximately 9000ft fumes returned. Liaised with cabin crew as to state of fumes and asked them to update if fumes worsened. Cruise phase uneventful in flight deck☐</p> <p>although fumes were intermittent in the cabin. On descent fumes returned and worsened. First Officer donned oxygen mask as a precaution and all cabin crew used crew oxygen for landing. 1 cabin crew member at the rear was sick after landing and 1 cabin crew member at the front was sick after disembarkation. During flight no medical symptoms were noticed by the flight crew, however post flight all 7 crew were feeling light headed with dry throats, some reporting headaches, slight numbness, tingling and particularly tired. Global lifeline have been contacted for medical assessment. During disembarkation several passengers commented about feeling particularly tired as though they had been on a very long flight.☐</p> <p>Supplementary 01/07/14:☐</p> <p>This aircraft suffered significant fumes in the flight deck and cabin for the whole of the flight. Fumes were significantly worse during the first 10 mins of flight and below 9000ft in descent. Air supply from APU contaminated with oil. On investigation APU air inlet contaminated with oil. External oil leak observed from APU generator mounting pad. APU u/s.☐</p> <p>CAA Closure: ☐</p> <p>The cause of the fumes event is unproven but is likely to have been due to an oil leak from the APU which was identified following the event. Following removal of the APU generator foreign material identified as possibly the remains of a blank was found on the generator mounting plate. The foreign material had contaminated both the lubrication seal and the structure of the mounting plate. The APU generator had been installed six months prior to the event with no reported oil leakage or fumes reports in this period. It has not been possible to positively identify when or how this material came to contaminate the mounting plate. Engineering personnel involved are no longer employed and therefore not available for interview.</p>
201409006	04/07/2014	AIRBUS	En route	Possible fumes event. Cabin crew, First Officer and passengers feeling light headed and nauseous.	<p>During descent at approx 16000ft cabin crew called flight crew concerned about the pressurisation because a crew member and a couple of passengers were feeling light headed and nauseous. After checking pressurisation the F/O complained of feeling light headed and went on oxygen. F/O went on oxygen, Captain did not. Situation in the cabin re-checked and only one crew member still affected. No smell in the flight deck or in the cabin front or rear. At approx 7000ft F/O came off oxygen, but shortly complained of feeling light headed again. F/O went back on oxygen and remained on oxygen until landing. No discernible odour present in cabin or flight deck. No ECAM warnings/cautions. Only crew member at rear and F/O affected. Once parked cabin crew at rear mentioned strong fuel smell upon landing.☐</p> <p>CAA Closure:☐</p> <p>Extensive troubleshooting and a comprehensive review of flight data parameters cannot confirm any technical defect related to☐</p> <p>the engines, APU, air conditioning, bleed or pressurisation systems of the aircraft that may have led to a decrease of cabin air☐</p> <p>quality/supply to cause the symptoms described. The aircraft will be monitored for any repeat occurrence and take action as appropriate.</p>
201407359	07/06/2014	AIRBUS	EGLL (LHR): London/Heathrow	Temporary acrid/electrical burning smell during climb and adjacent to an electrical storm.	<p>During climb and adjacent to electrical storm a perceptible electrical/burning smell was detected by flight crew. P1 called crew to oxygen(smoke/fumes QRH) which was carried out in turn by operating crew. The P3 was a commuter who coincidently was undergoing conversion to type(mid simulator phase) who before he was able to don oxygen was able to ascertain that the smell was quickly dissipating.QRH actions were stopped at this point and the operating crew removed oxygen. The crew considered that the event was likely cause by significant St. Elmo's fire arcing across the windscreens.</p>
201409993	24/07/2014	AIRBUS	EGPF (GLA): Glasgow	Strong smell of chemical/plastic fumes in the flight deck during initial climb.	<p>During initial climb a strong smell of fumes noticed in the flight deck (chemical/plastic). Initial actions of the SMOKE/FUMES/AVNCS SMOKE checklist carried out. F/O on oxygen as a precaution. Liaised with the Purser who said there was no smell in the cabin. Later reported a smell in the back galley and commented on the smell when she entered the flight deck. The smell dissipated during climb. At top the initial actions reconfigured and the smell had gone. Smell returned when Flaps run on approach. Aircraft had been in engineering. Carpets replaced.</p>
201410375	28/07/2014	BOEING	En route	Fumes on flight deck and in cabin near doors L2/R2.	<p>Pungent smell detected by both pilots. Also noticed by upper deck cc when on FD. Crew O2 used. Called down to main deck cc who had, together with some passengers, also noticed smell/fumes. Asked for LESS report. SFF QRH checklist initiated: seat/PC/IFE power switched off followed several minutes later by Utility Buses. It was not possible to identify the source of the fumes or positively confirm what type of fumes they were. Having carried out the SFF checklist there was no recurrence of the fumes and aircraft continued normally without further incident. Ops Control contacted via Satcom to ascertain if possible to obtain a direct approach from ATC [to avoid holding associated with weather disruption] without declaring emergency; given that fumes had dissipated. Ops Control advised would reply via ACARS; but no reply received from Ops. Maintrol contacted via Satcom to obtain information regarding previous fumes history. Info also requested re source of seat power, relative to the utility buses, as necessary to put 70 seats in land position. No reply until a further request sent via ACARS. The response did not give the requested info and was not helpful to the crew in terms of assessing merits or otherwise of whether to attempt to selectively and judiciously restore power for short period to put seats in land position.</p>
201409391	11/07/2014	BAE	EGNO : Warton	Electrical burning smell in flight deck.	<p>After commencing descent from cruise at FL180, a short time later Capt. noticed a faint smell of burning akin to overheating of a domestic appliance. The F/O was asked if he too could identify the smell, which within a few moments he confirmed. All engine/pressurisation/air-conditioning parameters appeared normal with no CAP visual/audio warnings/cautions. The descent was continued as crew monitored situation. A call was made to C/A who was asked if she could smell anything unusual in the cabin environment to which she responded No. The C/A and total of 5 POB were seated at the rear of the cabin. She proceeded to investigate forward by the flight deck door and later to report a smell similar to that of a burnt clutch on a car. The smell intensified in the flight deck over the intervening minutes becoming somewhat acrid, like melted electrical wiring, we discussed and actioned closing the RH flow control supplying the flight deck as an initial action after consulting CARD 14 ECL at this point, donning O2, masks a diversion seemed imminent. After adjustment of the RH flow to off, the smell dissipated fairly quickly reverting back to a level similar to that at the start of the event. Throughout the event, no visible smoke was seen or detected. The remainder of the flight was busy descending and handed over so the ECL was completed at isolation of the RH flow. A normal approach and landing followed, post shut down the Capt and F/O conferred to agree that both felt slightly light headed with a mild degree of irritation to the back of the throat. It is my understanding from debrief with the C/A that the 5 pax travelling remained:☐</p> <p>unaware of this occurrence. An entry was made in the tech log. LMC informed along with OPS.</p>

201411032	12/08/2014	BOEING	EGLL (LHR): London/Heathrow	MAYDAY declared and aircraft returned due to acrid fumes on flight deck.	<p>Climbing through FL200 an acrid smell became apparent on flight deck. MAYDAY declared and QRH smoke and fumes actioned and decision taken to return to departure airport. The acrid smell worsened with duration of flight and after smoke and fumes removal checklist actioned. Aircraft landed gently at 156,000kg. The fireman on entry stated the acrid smell was obvious and strong and the flight deck windows had been opened after landing. □</p> <p>and open for the taxi in and the shutdown. □</p> <p>Supplementary 12/08/14: □</p> <p>Aircraft declared MAYDAY with fumes in the cockpit and requested immediate descent and return to departure airport. MAYDAY acknowledged by tactical controller and aircraft asked to squawk 7700. Descent given to FL200 (after coordination other sectors) and the aircraft given a left turn back towards the airport. Aircraft transferred to discrete frequency. Aircraft was unable to dump fuel and requested emergency vehicles available on landing. □</p> <p>Supplementary 13/08/14: □</p> <p>Just as we were setting up the bars, approx 10-15 minutes into the flight, SFO called at Dr 1L and informed me that they were all on oxygen as they had a strong acrid smell on the flight deck and fumes present. He asked us to suspend the service until they knew more. I went to inform the CSD. She then received the NITS briefing not long after. We disengaged from duties ensuring the galley was secure and went to our inter phone stations. We were not told if it was going to be an emergency landing, just that we would be landing in approx 20-30 minutes and to start securing the cabin and galleys. The Captain made a PA informing customers that we would be returning to departure airport due to a technical problem, as he didn't want to give them too much information of the incident, however as they were noticeably on oxygen the customers began asking us questions as we were securing them in, which was pretty stressful, but I tried to reassure them that everything was under control and the flight deck would inform us of any changes. When instructed by CSD to take our seats for landing we immediately did so, mine being door 2L. I sat going through my silent review and emergency procedures, as we were still unsure if we would be going into a full emergency evacuation. At this point I had a severe headache. It was an extremely heavy landing and the reverse thrust was used for what felt like the entire runway. We then came to a stop and waited. The captain made a PA and explained that everything was ok, and it had been a relatively normal landing, but as we were very overweight the emergency services were there as a precaution. Customers remained very calm. At this point we noticed a strong smell of fumes around Dr2 area and I still had a headache. We taxied to a remote stand and the fire crew were the first to board the aircraft at 2L and check all was well on the flight deck. We did a controlled disembarkation, and then the CSD wanted to check we were all ok as a crew. The flight deck manager was there to meet the aircraft. Once back at CRC we still had headaches and decided due to the nature of the incident it would be best if we all got checked out by a doctor, so we informed the Doms of our decision and went to Hillingdon hospital for a thorough examination. We finally arrived at our hotel accommodation at 2.30am After take-off (approx 5 mins) I saw the First officer come out of the flight deck and advise the CSD to hold off setting up bars as there was a problem in the flight deck. Julie advised other cabins accordingly and then approx 5 mins after that she received a call at Door 1 left and got a NITS briefing from Captain. The all attendants call was then initiated by her and we all received the briefing. We were told we had 20 mins to landing back and started to prepare the cabins and galleys for landing. the was no galley power or power to the club world sleeper seats as this had been disabled from the flight deck , but passengers were secured for landing promptly . After a heavy and long landing into LHR we came to a stop and the captain PA'd the passengers explaining that the aircraft was fine and that we would be pulling onto stand and be boarded by the fire service. During the incident my eyes were sore and Itchy and I had a headache so the crew as a whole attended Hillingdon hospital A&E to have blood tests to confirm we hadn't suffered as a result of being in the fume environment I was sat at door 1 right , in flight deck and at the latter stages of the flight (approx 20 mins before landing) could smell an electrical burning smell in the galley area During the flight there was a fume event on the flight deck, we readied the cabin for an immediate return which would take approx 20 mins the CSD made the alert call and gave us the nits briefing. All crew checked the cabin s and reassured passengers, I smelt fumes during this time. After instruction from the CSD took our seats for an emergency landing. It took a lot longer to land as the a/c was heavy and fuel had to burn off, it was quite a heavy landing and a few overhead lockers opened. After taxiing off the runway it took a few minutes for the fire services to clear the a/c to the stand and after further checks the passengers, were disembarked to buses. Acrid /fume smell on flight deck, pilots on oxygen, nits briefing received and given to cabin crew, asked not to inform passengers of severity, emergency return. Smell spread to cabin within 10 mins of being told then very strong for 25/30 mins until landing. Throat and chest affected persistent cough and hoarse.</p>
201411077	13/08/2014	AIRBUS	LKPR (PRG): Praha/Ruzyne	Fumes in the galley during taxi in.	<p>As aircraft taxied in towards Stand, SCCM informed F/ Deck that the Cabin Crew at Aft Galley could smell fumes, of an alcohol based quality. The two crew members had donned portable oxygen as a safety precaution. There was no other evidence of fumes in any other part of cabin. Air conditioning Pack 2 was selected off, IAW Engine 2 shutdown on taxi in (SOP). Probable cause was ingestion of chemical cleaning agent used by Engineers, following a suspect Hydraulic leak in Main Landing Gear area. As safety precaution, 2 aft CM s used portable O2, until A/C on stand/ approx 5 mins. SCCM informed F/Deck immediately. On further communication, contaminant described as alcohol based, non toxic/ visible, and located Aft Galley area " only". Fit Crew elected to switch Pack2 off, in case Air Cond related. Once A/C on stand/ shutdown, further risk assessment completed. Both Front and rear Cabin doors opened. Pax disembarked normally. Odour disappeared very quickly. Engineer had been called to inspect A/C main landing gear area, following a report from Pushback operative, of a possible Hydraulic leak. The attending Engineer was required to clean the area, in order to make a thorough investigation. It is believed that the cleaning agent used for this purpose was an alcohol based substance. On completion of clean up and inspection, no report of hydraulic leakage or of any fluid loss. A/C was cleared to despatch. Flight operated normally, until taxi in at destination. Cabin crew members suffered stinging eyes, buring on the inside of the nose and a strong metallic taste in the mouth as well as bad headaches and sore throat. Crew member attended hospital for the effects of the fumes.</p>
201410779	07/08/2014	AIRBUS	EGBB (BHX): Birmingham	Fumes in the flight deck.	<p>On approach, a strange smell best described as burning plastic caused both flight deck to feel unwell. Oxygen masks put on. Auto land carried out. Both flight deck felt unwell on leaving the aircraft.</p>
201411419	18/08/2014	SAAB	EGPD (ABZ): Aberdeen/Dyce	PAN declared due to unusual sudden movement followed by fumes (electrical smell) in the flight deck.	<p>The subject aircraft's pilot made a PAN call on the Moray frequency requesting vectors to the ILS. I was monitoring a trainee at the time but via the mentor box I called the pilot to offer a heading and request the nature of the problem. He responded that the aircraft had made an unexpected Jolt and there was an unusual smell in the cabin. The PAN call was purely precautionary and he had donned his oxygen mask which made his RT quite difficult to make out. I asked if he needed assistance on the ground, he replied that the fire service being on standby would be sufficient. I called straight away and passed on the information. I also requested a lower level as the aircraft was close to levelling off and was given FL70. I descended the aircraft to that level and transferred it to Radar. □</p> <p>Supplementary 18/08/14: □</p> <p>Unusual and pronounced jolt of aircraft followed by instantaneous electrical smell. Spoke to cabin attendant then flight deck elected to go onto □</p> <p>oxygen masks. Declared a PAN and requested vectors for immediate landing. Smell discontinued - cabin crew given option to go onto oxygen but elected not to use it. Kept continued contact with Cabin Attendant throughout rest of flight - fire services on standby. Landed without further complications. □</p> <p>CAA Qlosure: □</p> <p>Extensive troubleshooting was performed with the input of Saab and Rolls Royce. Airframe inspection did not reveal any defects that could have caused the electrical smell in the flight deck. On inspection of the LH engine it was found to have a crack in the forward air inlet housing. On review of both borescope video and MDC/DFDR data, Rolls Royce stated the evidence pointed to the engine as the root cause of the cabin odour. The engine was replaced and extensive engine ground runs and maintenance check flight performed prior to release to revenue service. The engine is currently in shop for full investigation and the report has not yet been completed, however, indications point to excessive rub on compressor abradable lining being responsible for the cabin odour. Engine had accumulated approx. 1800FH since last shop visit. The engines are condition monitored with engine trend data and routine borescope inspections. No implementation actions have been taken by the operator as yet or recommended by Saab or Rolls Royce, however the other engines on the fleet were inspected at the time for similar cracks.</p>
201411270	16/08/2014	BOEING	EGLL (LHR): London/Heathrow	PAN declared due to strong burning smell/fumes in flight deck.	<p>Very strong fumes smell came on suddenly in flight deck. Crew went immediately onto oxygen. Crew comms established with both flight and cabin crew. CSD came into flight deck and immediately agreed that there was a very strong fumes smell. Cabin checked throughout and CSD briefed crew. No fumes in the cabin. PAN call made and expeditious approach flown. Contact established with fire service. Once situation reviewed and taxiing the aircraft to stand was deemed safe, we parked and disembarked passengers. Fire crews then checked flight deck. Passengers were not informed and disembarked before fire service came on the aircraft. Crew briefed regarding fumes and to contact company if they became unwell. □</p> <p>Supplementary 16/08/14: □</p> <p>Aircraft was being vectored downwind for arrival when he declared a PAN due smoke in the cockpit. Several aircraft were broken off to expedite his approach. □</p> <p>CAA Qlosure: □</p> <p>Investigations traced the problem to the runway turn-off light auto transformer T138. It was drawing excessive current, causing the RH runway turn-off switch to melt, the C/B N33 to trip and the fumes/ burnt rubber smell on the flight deck. A review of usage shows no usage for many years and this is not a known problem on the fleet.</p>
201411890	28/08/2014	AIRBUS	En route	Serious Incident: PAN declared and diversion initiated due to smoke in flight deck. Flight crew donned oxygen masks. 163 POB, no injuries reported. AAIB AARF investigation.	<p>CAA Qlosure: □</p> <p>During the en-route climb, the caption 'avionics smoke' was displayed on the Electronic Centralised Aircraft Monitoring (ECAM) display and the crew could see smoke emanating from the right side of the centre console inside the co-pilot's footwell. The aircraft diverted and, during the descent, the smoke stopped. It landed without further incident. It was found that a component in a static inverter, powering electrical outlet sockets in the cockpit, had overheated. AAIB Bulletin 12/2014, Ref: EW/G2014/08/13.</p>
201411688	25/08/2014	AIRBUS	En route	PAN declared and aircraft returned due to fumes in the flight deck and cabin.	<p>Aircraft requested to return due to a minor technical problem. When on the TC LAM frequency, aircraft declared a PAN due to oil odours in the aircraft. The pilot reported that the odour was strong on departure although it had subsequently become less intense but was still present. He also reported that the particular aircraft had a history of the problem. □</p> <p>Supplementary 05/09/14: □</p> <p>Shortly after take off, cabin crew member came to the forward galley to inform me that she was aware that on take off and into the flight there was a strong smell of fumes I advised her to call the flight deck and give them as much information as possible. For example when she was aware of the smell and what type. This was also noted by fellow crew member. The Captain then called me into the flight deck to say he had a conversation with her, and had checked the flight log and there was details of the same problem before on this aircraft. With that information he was going to call me back into the flight deck for a NITS briefing. The call was made and myself and the nearest crew member went into the flight deck; N - fumes in cabin returning to departure airport, I - normallanding and txi to stand, T- time 15/20mins depending on holding, S - special instructions to secure the cabin for normal landing. I gave the NITS briefing to the crew. They understood their roles and responsibilities. The seat belt sign had remained on during this time, a PA was made to inform the customers we would be returning due to a technical problem. Cabin was made secure. The customers asked a few questions and we reassured them this was normal procedure for us to return. The cabin was made secure for landing and checks completed to the flight deck via the indicator outside the flight deck (white) I briefed the crew about their silent review and door drills We landed as normal and went to stand 25. At all times my crew were very calm and professional. No SEP equipment was used. After landing the flight deck crew informed me that they had been on oxygen for the last 10mins coming into to land due to strong fumes in the flight deck. All customers feedback was fine just frustrated about the return. TRM came on board and they were taken from the aircraft by coach into the terminal and given vouchers. The flight was rescheduled for 15-00 with new aircraft and new flight deck and cabin crew. □</p> <p>Supplementary 20.09.14: □</p> <p>Soon after departure strong odour experienced on the flight deck. Both agreed this was an oil type smell. Intensity immediately dissipated to an insignificant level. □</p> <p>Event discussed. A/C had just returned from maint due to prior fume event. Maintrol consulted. When contacted, C/crew confirmed existence of transient fumes on T/O. Decision to return to LHR in conjunction with Maintrol. On approach, fumes returned this time to a strong intensity. Pan declared. Oxy masks used on flight deck as a precaution. Later, fumes checked dissipated. PNF initially, then later PF removed masks. Overweight landing checklist applied. □</p> <p>CAA Qlosure: □</p> <p>Cause traced to No1 engine which was removed and replaced. Root cause is still under investigation with the engine manufacturer. SDD requested further information from closing surveyor once engine investigation completed. Aircraft is reported to have no further occurrences post engine change.</p>

201411820	25/08/2014	BOEING	EGLL (LHR): London/Heathrow	Returned to stand due fumes event.	On lining up on the runway an intense burnt rubber/roast chicken smell was encountered in the flight deck. We elected to vacate the runway for investigation. The smell remained but dissipated slightly. On consultation with engineering we elected to return to stand. The Smoke, Fire or fumes checklist was discussed but not considered useful as the stand was close by. However on turning on to stand, the intensity of the smell increased markedly and oxygen masks were donned as a precaution. When on the stand, the smell dissipated on selection of the recirculation fans to off, as advised by the engineer. The aircraft was considered unserviceable pending further investigation and the passengers disembarked. On taxi out flight crew called for me to enter flight deck as they could smell rubber/roast meat smell which was very pungent. I walked the cabin and same smell occurred in door 2 area. We returned to stand and offloaded passengers. Spoke to Dom's who in turn spoke to the crew who did not feel well. Two crew did not continue with the trip on the new aircraft they have completed incident reports for their version of events. As the aircraft turned onto the runway for departure I could smell something burning. it smell like burning rubber. I was sitting at door 2 right. I commented to my colleague and he confirmed that he could smell something also. As the aircraft accelerated the smell became stronger. The take off was subsequently aborted and the aircraft returned to stand. The CSD at door 1 left confirmed the smell was also present in that area and also in the flight deck. I was questioned by the CSD as to my observations and reactions. There was an irritation at the top of my nose (inside) since I had breathed the fumes but I was not feeling nauseous. I was asked to speak to the DOM from the aircraft by mobile. I recounted to him my observations and he advised me to stand on the jetty to breathe in fresh air and also drink lots of water. The Dom offered to take me off the re-scheduled trip. As I already knew the flight crew had been taken off I thought this would be the most sensible decision for myself also. I followed the advice of the DOM. He has given me an advice following fume event leaflet to read.During taxi onto the take off runway I detected an acrid smell like burning meat. The aircraft then taxied down the runway. CSD then confirmed that he could smell fumes in the cabin as in the flight deck. He asked how I felt. I had a scratching at the back of my throat and in my nose. After taxing to stand and the door opened I started o feel better. I drank water as recommended by Dom. I got back onto aircraft and started to feel dizzy and the scratching sensation returned. DOM offered the option to be stood down and return home. Strong noxious fumes smelt in F/D. Very slight headache which went after drinking water and having some fresh air.
201412830	11/09/2014	BOEING	LGZA (ZTH): Zakynthos	Electrical burning smell followed by EICAS cautions and erratic indications on Captain's ADI.	Passing FL 310 in climb to FL360, electrical burning smell followed by EICAS Cautions: RUDDER RATIO, IAS DISAGREE & MACH TRIM together with Speedtape on Capt's ADI fluctuating wildly up and down. Control handed to Other seat and Auto Pilot disconnected as A/C attempted to level off just above FL310. Climb re-established & F/O's indications were assessed as normal for stage of flight. Right Auto Pilot engaged and burning smell dissipated, Pilot in right seat put on Oxygen Mask as precaution. EICAS Cautions extinguished approx 2 minutes later and Capt's speedtape returned to normal operation. Smell stopped and decision to continue taken with close monitoring of systems using Right Autopilot.☐ CAA Closure:☐ The root cause of the event could not be established and has not been repeated since. An autopilot operational test was carried out through the MCDP and an air data computer operational test also carried out. All tests satisfactory. Inspection around and behind the captain's instrument panel carried out for signs of overheating/burning with no defects found. A review of all defects reported on the aircraft since the incident have found nothing similar.
201413319	20/09/2014	AIRBUS	En route	Electrical fumes in flight deck. PAN declared and aircraft diverted.	During the cruise, flight deck summoned myself cm to the flight deck as they could smell fumes and wanted to know if I had noticed anything. On entering I could tell that there was an overpowering acrid smell in the flight deck. I explained it smelt like burning electrics. The flight deck were concerned and asked if it was coming from the vent. I smelt and informed no and the flight deck were also looking to see if they could determine where the smell was coming from. After a while approx 2 mins, the flight deck asked myself to get cc4 to enter when I left to see what she could smell too. I left informed the crew at the back what was going on and the cc4 had the same issues. Afterwards I went back to see the flight deck and more information from them. NITS received. N-burning electric smell in the cock pit. I- diverting. T-time 20 mins, 08:10 local S- prepare for a normal landing. Flight deck also advised that they were going to don their oxygen masks as well. I left the cock pit, asked all crew to come to the rear galley and a NITS briefing was conducted to all crew and all crew repeated back. Captain had advised me to secure the cabin after the NITS which is what I did and then the captain did a pa straight away to inform the crew. Passengers remained calm throughout, crew very professional and remained calm at all times. No panic in the cabin at all and we all worked well as a team, communication line kept open at all times with all crew. Secured cabin and passed on cabin secure checks to flight who then advised 8 more minutes to landing. Landed as normal, and we got the pa crew normal operations and then disarm doors for arrival, passengers remained seated as per my pa until the captain spoke to them. Fire engines followed the aircraft, police boarded and engineers. Ops contacted via flight deck and pax disembarked approximately 30 mins after landing to check out to re check in for another aircraft and crew disembarked and waited in the terminal for a passenger flight home. Passengers commented on how well we communicated all of the information, no distress from pax and in fact all were smiling when they got off and congratulated us on our expertise and professionalism. All crew and flight deck worked extremely well together.☐ Supplementary 20/09/2014:☐ Shortly after aircraft levelled in the cruise, both flight deck crew noticed an acrid burning smell fill the flight deck. It was a strong smell like burning plastic. The CM was called, who was in the forward galley, on the interphone. He noted that there was nothing abnormal in the cabin and although the oven was on there was no associated smell from it. CM was invited in to the flight deck upon which he confirmed immediately on entry that there was a very strong smell of burning in the flight deck. The electrical equipment visible in the flight deck was checked for abnormal heat and smell with nothing found. CM smelt avionics bay air vent forward of cockpit door with no smell sensed. CM left and other CC invited in to see if they could sense smell which they could immediately. Air vents in flight deck were turned on and smell seemed to reduce but not entirely disappear. When air vents turned back off, smell increased back to same intensity as before. Cabin and toilets checked and appeared / smelt normal. At no time was there any visible smoke present anywhere and passengers did notice anything. With the smell solely in the flight deck and with no ECAM, or signs of it alleviating, flight deck suspected an avionics bay issue and a precautionary diversion was initiated for further investigation. A NITS brief was given to the crew and passengers and company advised. A PAN call was made to air traffic with the request to divert. As a further precaution, flight deck went on oxygen masks for the remainder of the flight. The cabin air remained stable and therefore ATC advised that there was no immediate threat to the occupants and therefore a taxi to stand with fire brigade in attendance was required. Upon arrival on stand, Fire Brigade confirmed that the cabin environment was safe, as we believed it to be, so passengers remained onboard. Engineers arrived very promptly and could immediately smell the burning smell we had sensed. Upon opening the forward avionics bay, they said there was a very strong abnormal smell in there. Passengers were disembarked normally. After completing post flight duties flight crew, as a precaution, went to the medical centre for a health check. Both flight deck and the CM had sore throats. All crew were deemed fit.☐ CAA Closure:☐ Initial inspections of the components in the flight deck and avionics bay, along with all systems, air conditioning, engines and APU revealed no faults. Two days later the standby pitot probe had a defect where it went unserviceable and was replaced due to the heater element being burnt out and at that stage it was not known if the probe was a contributing factor to the smell two days prior as the shop report had not been received back. Subsequently, there have been no further reports of any smell in the aircraft since the event. Continues to be monitored through reliability in order to identify trends.
201413413	22/09/2014	BOEING	VABB (BOM):	Fumes in flight deck.	All three pilots smelt strong chemical/rubber smell on flight deck. Captain donned oxygen mask. Smell disappeared after approx 5 mins. No smell in cabin.
201413531	24/09/2014	AIRBUS	EGLL (LHR): London/Heathrow	PAN declared due to fumes in flight deck and cabin.	During takeoff fumes smelt (possibly oily). Cause unknown. Initial Actions of SMOKE/FUMES/AVNCS SMOKE completed Result - smell partly dissipated. Elected to continue in that configuration. Reset config later in flight to test smell. Smell returned strongly, Reset config as per QRH drill. First Officer felt increasing nausea. Flight crew went on oxygen, pan declared. During flight cabin crew reported very little smell however one had some nausea and another started to sneeze with a runny nose. Flight continued without further event. No pax complaints. Cabin crew reported smell strongly on taxi in. All crew checked at medical centre and cleared ok.☐ Supplementary 24/9/14:☐ I could smell a strong smell of fuel on the ground. The captain had done a pa to say we were sat behind a queue of 12 aircraft so I didn't inform scdm as this happens regularly and the smell dispersed. Just before takeoff I felt slightly dizzy but didn't think anything of it. We went out and done the service as normal, just as we had finished the service the PSR came down to inform us that both the flight crew were on oxygen and asked if we could see/smell anything which we then couldn't. After landing we all went to the medical centre to be checked out.
201415549	02/11/2014	BOEING	KBOS (BOS): Boston/Gral E.L.Logan Intl, Ma.	Fumes in cabin during take-off.	Whilst waiting to take off, Fumes from other A/C filled the cabin. The smell was overpowering resulting in headache + feeling nauseous. Oxygen was administered this happened whilst positioned at end of the runway waiting for clearance for take-off, approximately 30 - 35 mins. Oxygen Administered. Whilst taxing, we became stationary for approx. 30 mins. During this time a strong smell like exhaust fumes by doors 2L & 2R was so bad we used our scarves to cover our face/mouth nose. As I developed a headache and slight cough, I took 1 x paracetamol and had some oxygen. Cough still evident after landing.
201414405	12/10/2014	AIRBUS	En route	Burning smell in the flight deck due to Nr1 air pack overheat.	Sector 1 - pack 1 regulator fault => led to a pack overheat. Followed the ECAM procedure. Capt thought he smelt something, but very mild and unsure, FO thought it was the breakfast cooking, unsure of smells. After a minute we did not smell anything, and so considered that there was no issue. Landed uneventfully. Sector 2 - repeat, pack 1 reg fault => led to pack overheat. Followed ECAM again, however strong acrid smell (smelt by both Capt and FO). The smell was repeatedly smelt at least 3 times, after pack 1 was turned off. We both decided it was the correct decision to don oxygen masks as precautionary measure. We completed the flight without incident. We were asked to help with the run up tests on the aircraft to help with the maintenance. Capt and FO to have medical by Doctor for fumes, spoke to duty pilot and given details.☐ Supplementary 12/10/14:☐ During the first flight, flight deck informed me that there was a technical problem with the air pack 1 and we would wait for the engineer to verify the problem. if there was no engineer we would have to divert. We landed and the problem was looked at by an engineer and we were given the okay to leave. The problem reoccurred during the second sector in flight. I was called by the flight deck, the captain told me the problem was still there and we would again wait for an engineer at destination. 10 minutes later the captain called me to say that there was a strange 'burning' smell in the cockpit and to follow procedures they felt 'unwell' and would be on oxygen. No NITS was given. We landed and the flight deck told me that they felt 'queasy'. we waited for an engineer to arrive and to inop the airpack 1 before we were moved to a remote stand to carry out tests on the aircraft. After 4.5 hours in the aircraft with just the cabin crew, the engineer 'okayed' the problem and we checked-out.
201415527	03/11/2014	AIRBUS	EHAM (AMS): Amsterdam/Schiphol	Fumes in rear galley.	Approx 15 mins to landing, Purser reported that cabin crew had noticed fumes in the rear galley area. It was assessed as noticeable but with no adverse effects, and there was no visual indication of smoke. Capt instructed the purser to monitor and report if situation deteriorated. Normal Approach and landing achieved with no escalation of problem. When aircraft was approaching stand, Purser reported that the fumes were worse in the rear and one crewmember had donned oxygen. Following initial feedback and no further escalation of fumes in flight, ac completed a normal approach and landing. After landing, No.2 engine was shut down for SOP single engine arrival. After the report of worsening fumes with the aircraft approaching stand, flight crew agreed to continue onto stand and reassess. After engine shutdown, comms between flight deck and rear galley established that the fumes were localised to rear galley area and containable, so a normal disembarkation carried out. At the time of the initial report, the ac was experiencing moderate turbulence in heavy rain, and for a brief period, flight crew could smell an electrical 'ozone' odour although this could not be confirmed as the same smell as that in the rear galley. Also, during taxi, the smell experienced by the cabin crew was classified as 'different' but more severe.
201413913	02/10/2014	BOEING	EGLL (LHR): London/Heathrow	Fumes event	Strong acrid burning smell in cockpit during late stages of approach (approx 1800ft) located more to the right side of cockpit. First officer put on oxygen mask and approach and landing continued. Smell dissipated by touchdown. No further occurrence during taxi but hot electric smell reported by stewardess in first class on disembarkation
201415836	10/11/2014	BOEING	En route	Strong electrical burning smell in flight deck during climb. Aircraft returned.	Strong smell of burning in flight deck only, confirmed by CSD and returning P3. PAN declared, Fuel dump and return. Most likely cause from burnt out compactor situated behind flight deck. Smoke fire fumes checklist actioned. Oxygen masks donned. Actioned all gnd tests for air con systems and:☐ equipment cooling fans actioned tests passed no impending sts messages of any failures. Equipment bays checked. Noted fwd galley trash compactor cb tripped suspect trash compactor was source of fumes. Cb reset smell started to appear in flight deck, CB tripped smell dissipated. ADD raised for trash compactor replacement. Flight deck o2 masks restowed.
201416458	20/11/2014	AIRBUS	EGLL (LHR): London/Heathrow	Oil fumes in the flight deck.	Captain informed crew that they had shut down one of the air conditioning units due to fumes coming from oil in the engine. They had to put on Eros oxygen masks. Although I could not smell anything fumes may have leaked into the cabin. I was not advised to use oxygen and if the captain had not advised us of the event I would have been totally unaware. The captain filed an asr report.

201415684	07/11/2014	AIRBUS	EGLL (LHR): London/Heathrow	Fumes in flight deck and cabin. PAN declared.	Increasing fumes in the flight deck. The last two departures in this aircraft we had just after T/O an ECAM Caution. AIR, ENG 1 BLEED FAULT. Ecam drill completed and flight continued as the hot dusty metallic smell had disappeared. This smell was also reported by the cabin crew at the rear of the aircraft. During Descent on return sector we were made aware by the crew independently of a series of hot dusty smells in the rear of the cabin. We asked the crew to investigate and they reported back nothing unusual just the smell. Csd visited the Flight Deck and remarked that the smell was stronger in the flight deck and not noticeable in the forward galley. We went on oxygen and started the Smoke Fumes Avncs smoke QRH checklist. Pan call made to ATC and a priority approach was made to 27R. Alert call given and NITS brief given by Interphone for a normal landing. Normal Landing. We vacated the runway and were inspected by the airport Fire Services nothing found and we taxied to stand as normal.
201416717	30/11/2014	BOEING	EGLL (LHR): London/Heathrow	Fumes in flight deck and passenger cabin during final approach.	Established on final approach to runway, Flight Crew detected fumes of, initially, a diesely smell becoming aroma of heated plastic. Captain, P2 for sector and therefore pilot handling on approach, assumed ATC comms monitored by P3. First Officer (P1), donned oxygen mask then, following Crew agreement, assumed control as standard after "stable" call. Aircraft landed in normal fashion. "Smoke, Fire or Fumes" checklist actioned on leaving the runway. Unable to locate source of fumes during short taxi to parking stand, and also to confirm at what point fumes dissipated after shutdown. After landing Cabin Crew consulted. They reported similar smell on approach at doors 2L and 3L, also spurious passenger call light activity and cabin chimes. Passengers remained unaware of fumes and were disembarked as normal. Flight Crew had face to face conference with attendant Engineer reporting all aspects of event. Flight Crew debriefed event with Flight Crew Duty Manager.
201417669	18/12/2014	AIRBUS	EGLL (LHR): London/Heathrow	Serious Incident: Fumes in cabin and cockpit. Pilots	
201416882	01/12/2014	DE HAVILLAND	En route	Fumes on a/c affecting cabin crew.	My C3 was also affected. During the service I had to run to the back to get something from the bar at the back and noticed a funny smell. I rang the Captain at this point to explain. It smelled like nail varnish or remover. As we moved towards the back we noticed the smell had got worse. Between rows 16-20. We both felt dizzy and had headaches, C3 felt her sight was blurry. When we updated Captain, he advised C3 to get on Oxygen. As soon as we got on Oxygen we felt much better. We left work with a headache and not feeling well. I asked passengers sitting around the area if they had been painting their nails and to check bags to see if nail varnish had burst, but none had.
201416698	29/11/2014	BOEING	En route	Fumes in cabin.	Rear Cabin Crew reported via the CSD a strong sulphurous smell moving from the rear galley as far forward as 6 passenger rows. Two Cabin crew felt the need to breath oxygen for a short while. Shortly thereafter the smell dispersed, Smoke, Fire or Fumes QRH check list was referred to but not actioned.
201417909	23/12/2014	BOEING	LCLK (LCA): Larnaca	Smell in galley during taxi.	While taxiing out as I walked from doors 3 to doors 4 I smelt a very strong sulphur smell, similar to rotten eggs. I immediately got a headache and nausea and had to go on oxygen. I immediately called the Cabin Manager to inform her of the smell. I returned to my seat at doors 3 ready for take off but immediately. The smell dissipated and then returned for about 20 seconds just after take off.☐ Supplementary 03/01/15:☐ On taxi out to rwy22 via c received a call from the cabin describing a very bad smell in the cabin, to the extent a couple of cabin crew used their portable oxygen bottles. The smell was described as rotten eggs. The aircraft was brought to a halt, park brake set. We discussed the use of the smoke, fire and fumes check list and reviewed it. The bad smell disappeared after about 2 mins. Cabin crew reported cabin was now clear and were happy to continue. Both pilots discussed potential sources and as the cabin remained clear for the rest of the taxi decision made to continue the flight. At no stage was the smell experienced on the flight deck. Before either pilot could visit the cabin the smell had gone. We received a further report of the smell reoccurring briefly on getting airborne. The smell did not return after that. Two crew members complained of headaches and were advised to sit down for a while, flight deck was offered. Cabin crew reports:☐ "While taxiing out, I could smell a strong smell of sulphur similar to rotten eggs. I immediately got a headache which lasted for a couple of hours. I felt quite bad that I had to go on oxygen for a little while which helped."☐ "I was sat at doors three...during taxi i smelt a strong smell of sulphur.... I did not have any symptoms during the flight but def smelt something I have never encountered before."☐ "As I walked from doors 3 to doors 4 i smelt a very strong sulphur smell, similar to rotten eggs. I immediately called the CSD to inform her of the smell. I returned to my seat at doors 3 ready for take-off but immediately had a headache and nausea. The smell dissipated and then returned for about 20 seconds just after take-off. The headache lasted for about 2 hours but nausea went after having oxygen once i could get into the galley."☐ "On push back, the crew alerted me that there was a strong egg smell/sulphur in the rear galley and last few rows, then doors 2&3 called me and said the same, we could then smell this strong smell in the fwd galley also. Rear crew went onto oxygen in the rear galley. I informed the flight deck they said they had no smell and thanks for letting them know and would keep me updated. Taxing the rear crew called me and said the smell had now gone and also at drs 1,2,3 flight deck listened in to the conversation and confirmed the smell had gone. No customers were aware at all. The two cabin staff complained of a headache for the rest of the flight, they were told they could sit out the service and go into the flight deck but they wanted to work. I never smelt the smell again during the flight and the Captain came to speak with the crew all the relevant forms were filled out and i called the Doms on landing to let them know and if they wanted to see any crew that had been on Oxygen. Only 1 bottle of Oxygen was used and this was logged. This did not impact the service. I ensured all the crew were ok throughout the flight and so did the Captain He also filled out the relevant forms I also had the same incident on the 29th November."☐ "Had a severe smell in the cabin of sulphur (rotten eggs)....reported it to the CSD immediately, was then informed the rest of the crew had the same smell."
201416919	03/12/2014	BOEING	EGLL (LHR): London/Heathrow	PAN declared due to smell of oil in flight deck during take-off and landing.	Upon takeoff and initial climb strong smell of oily fumes in flight deck. Takeoff/Climb continued, QRH 8.6 smoke/fire/fumes actioned , Cabin Manager contacted, no evidence of fumes in cabin. Heavy pilot put on oxygen as a precaution. Fumes dissipated within 5 minutes, Maintrol consulted, nil evidence of technical problems. Utility buses/EQUIP cooling/APU BLD reinstated as per QRH, nil further. Flight continued. ATC informed of possible technical defect (nil specific). Kept on headings and FL 130-150 until we were ready to continue. Very helpful radar control.☐ Supplementary 03/12/14:☐ At top of descent, smell of oily fumes in flight deck. All three crew donned oxygen. Continued approach and landing. Upon arrival Engineering consulted. PAN declared with ATC. Fire trucks upon arrival even though we didn't ask for their attendance, stood down with ATC when we taxied clear of runway.
